Complexity

Understanding the level of complexity

Reductionism

The property of a system is the sum of the properties of its constituents and their local interactions

Holism

The property of a system is more than the sum of the properties of its constituents and emerge from the global interactions among themselves under specific context/environment

Reductionism

- Biological reductionism - Reductionism takes upon a mechanistic viewpoint, treating biological systems as analogous to machines with identifiable parts and interactions.

Reductionism

Father of Reductionism - René Descartes (1596–1650)

- Involves analysing systems at different levels of organization to uncover underlying mechanisms that govern their behavior.
- Influence of reductionism extends to interdisciplinary studies that combine various fields to solve complex problems.

Systems Theory

Systems theory is a conceptual framework based on the principle that the component parts of a system can best be understood in the context of the relationships with each other and with other systems, rather than in isolation.

Systems theory was first introduced in the 1940s by biologist Ludwig von Bertalanffy

Systems Biology

Systems biology aims to understand how biological functions emerge from interactions between the multiple components of living systems by modelling the (dynamics of) interactions and processes.

Not just this!

But this !

Translational research

Translational research: refers to the process of translating scientific discoveries from the laboratory into practical applications that benefit human health and society. It involves bridging the gap between basic scientific research and clinical or real-world applications.

Translational research

00

Attributes of a bioengineer

A very diverse field and includes all the technologies associated with the application of engineering processes in developing devices, pharmaceuticals, biologics and other products for the prevention and treatment of diseases.
