

Perkin Reaction

Acid anhydride + Non-enolizable aldehyde + weak base usually the salt of acid (chosen in such a way so that Nu^- attack on anhydride does no harm)

Synthesis of coumarin from salicylaldehyde

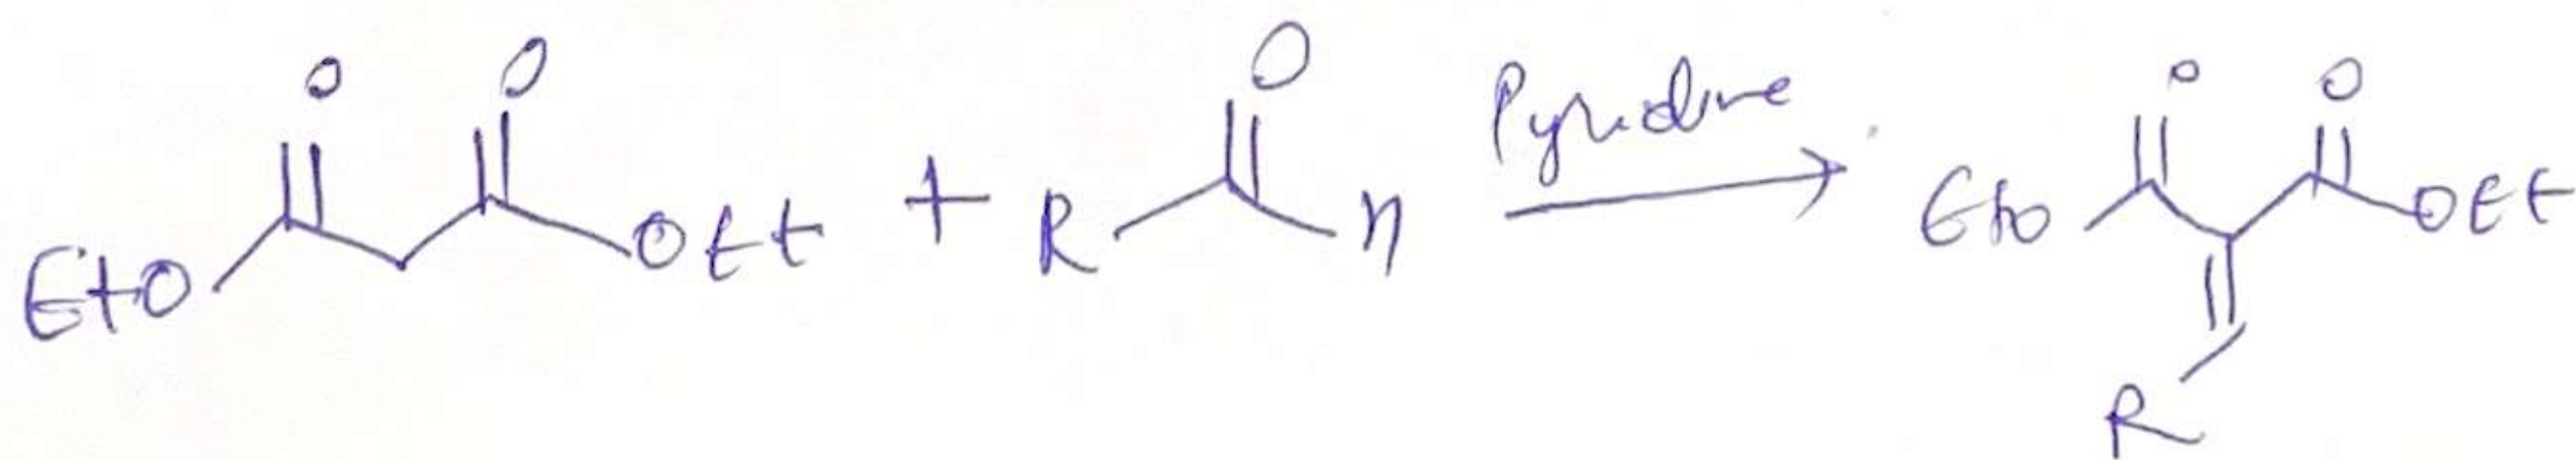

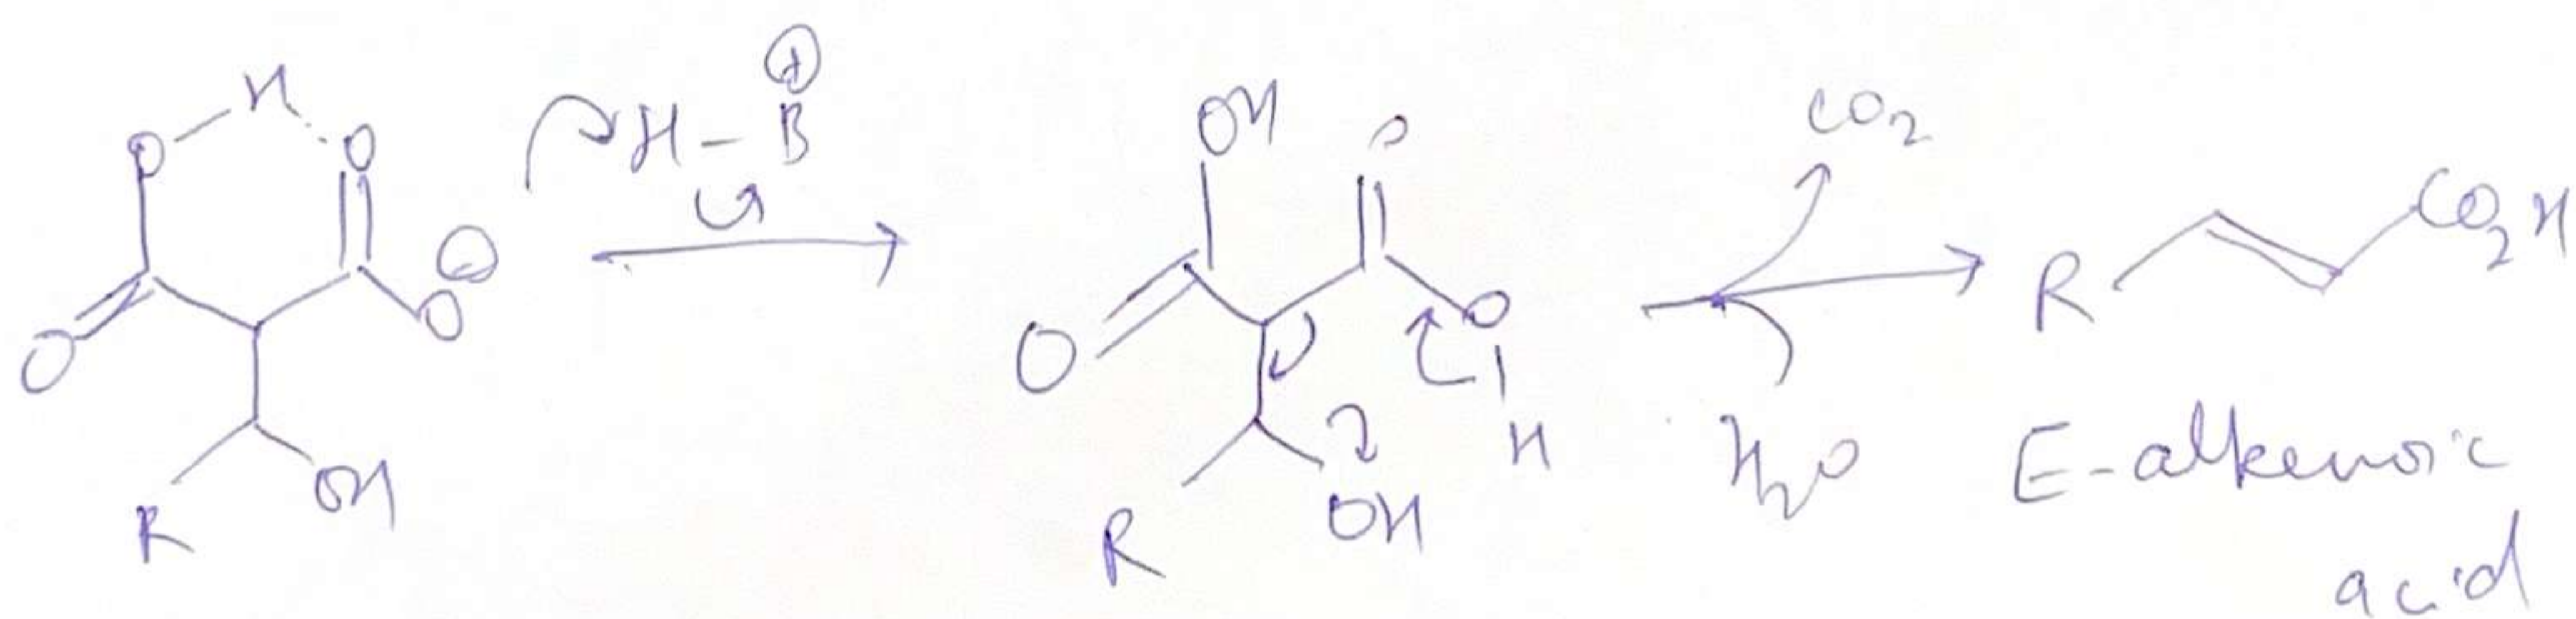

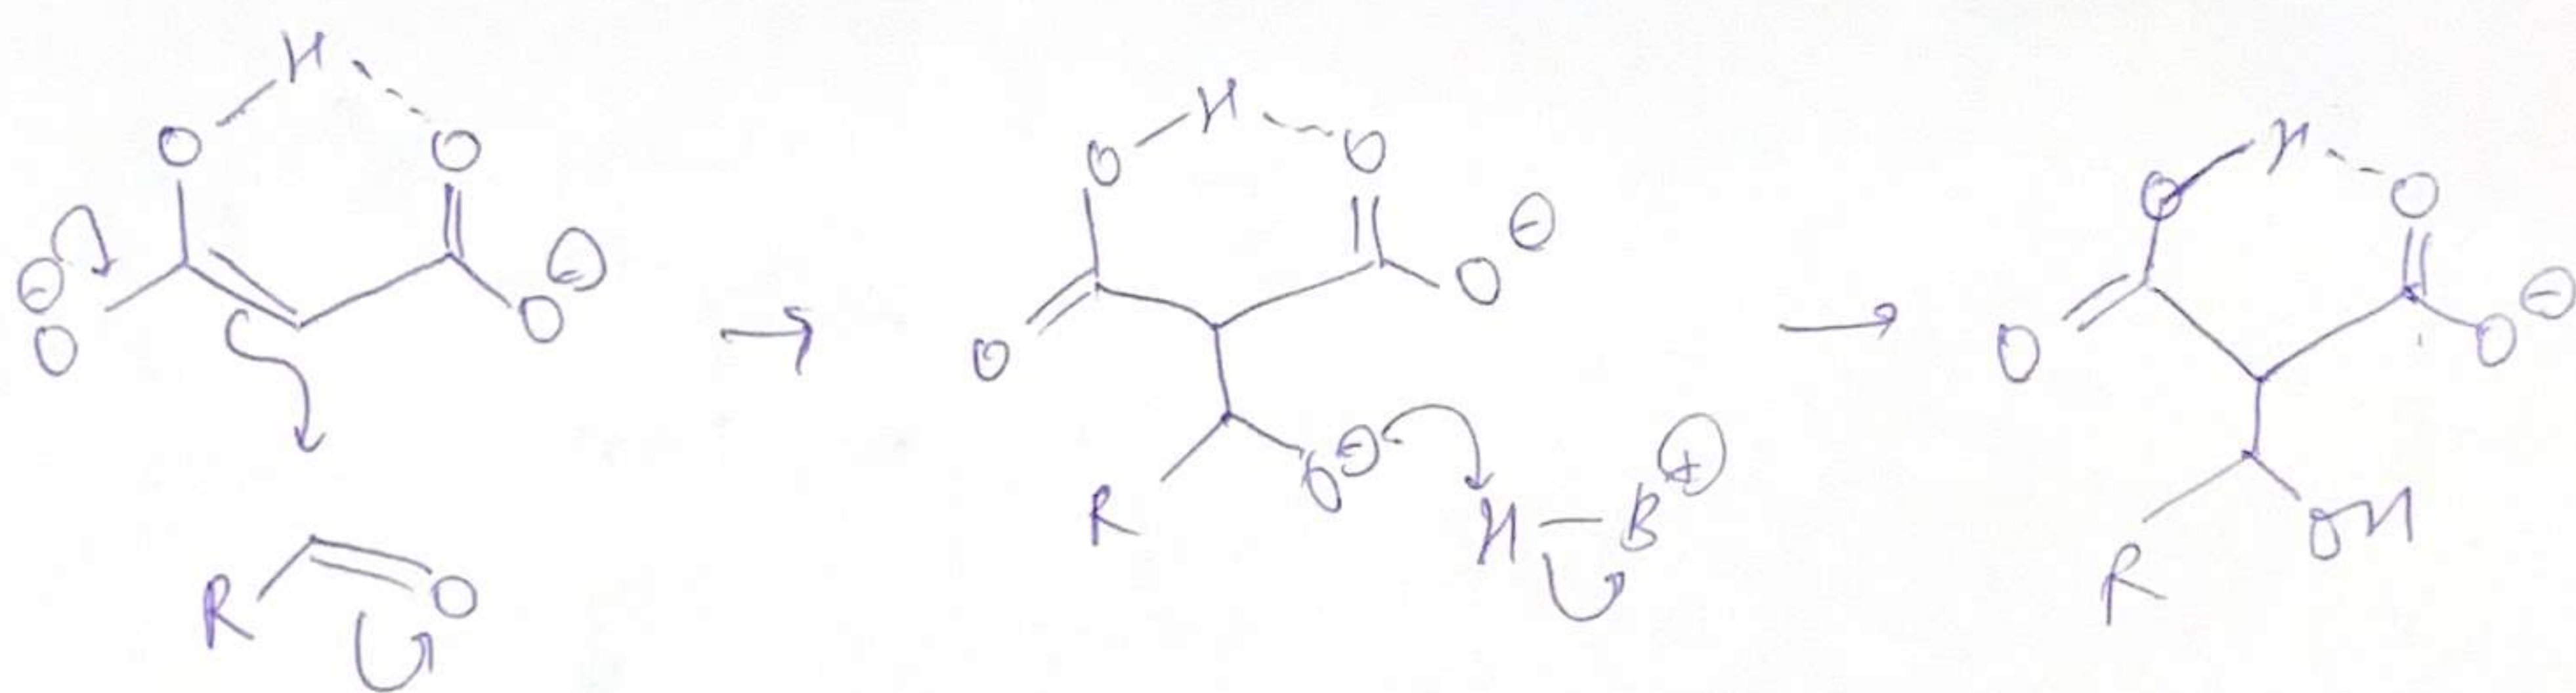

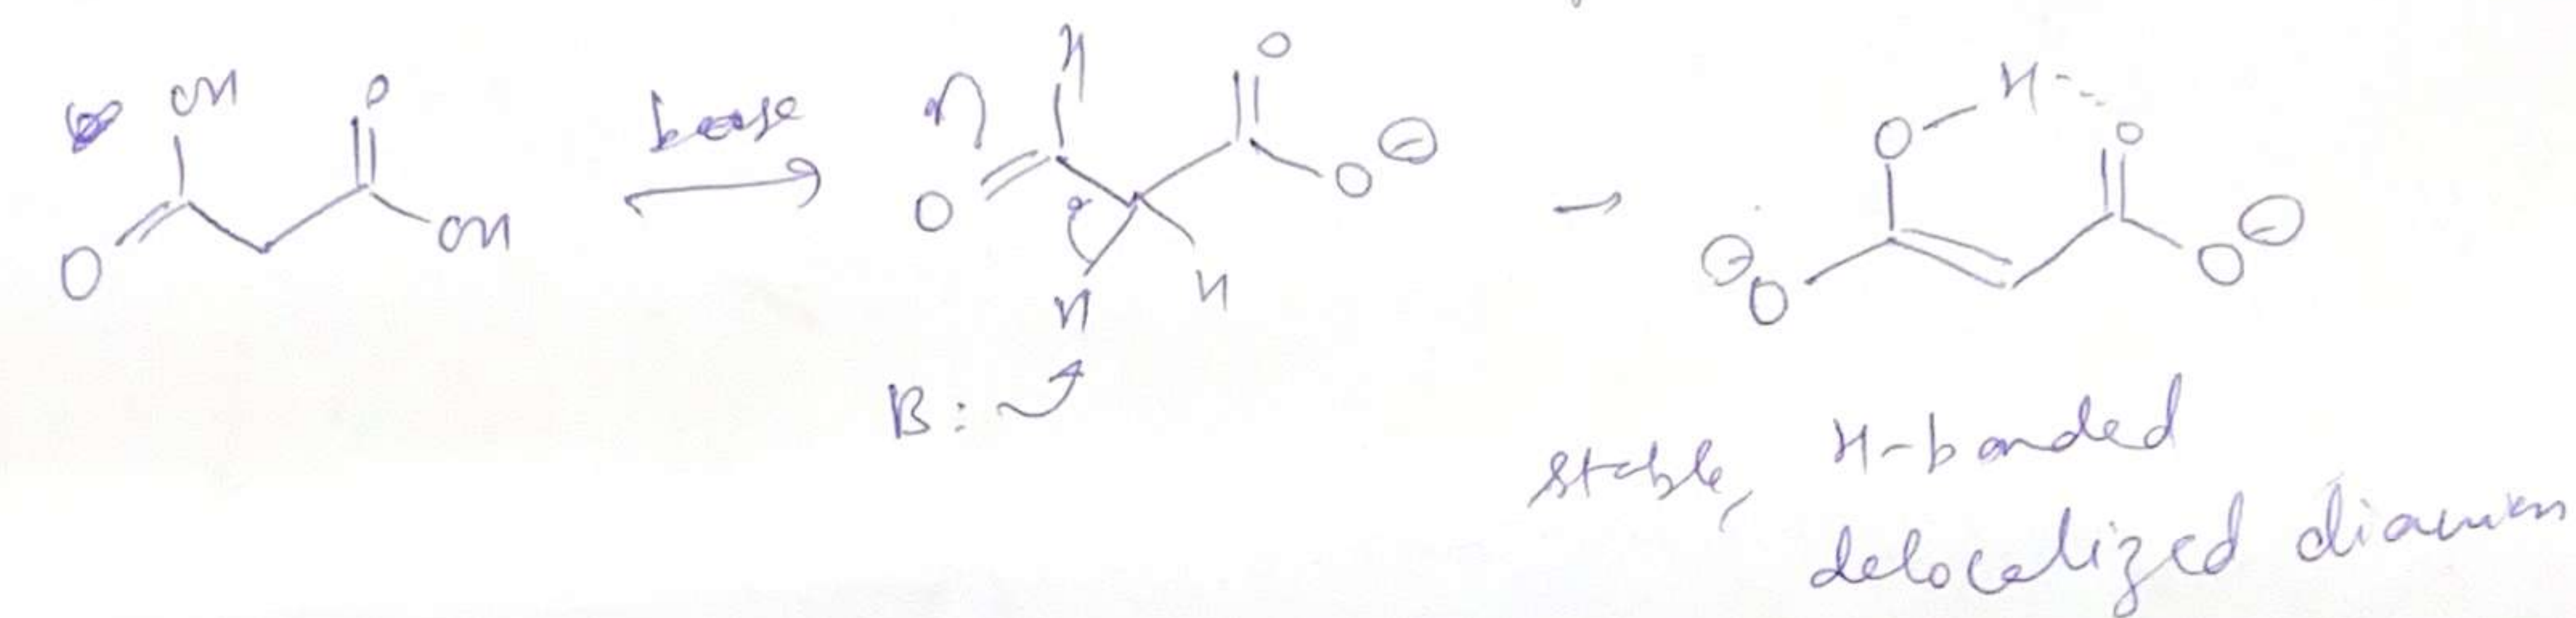

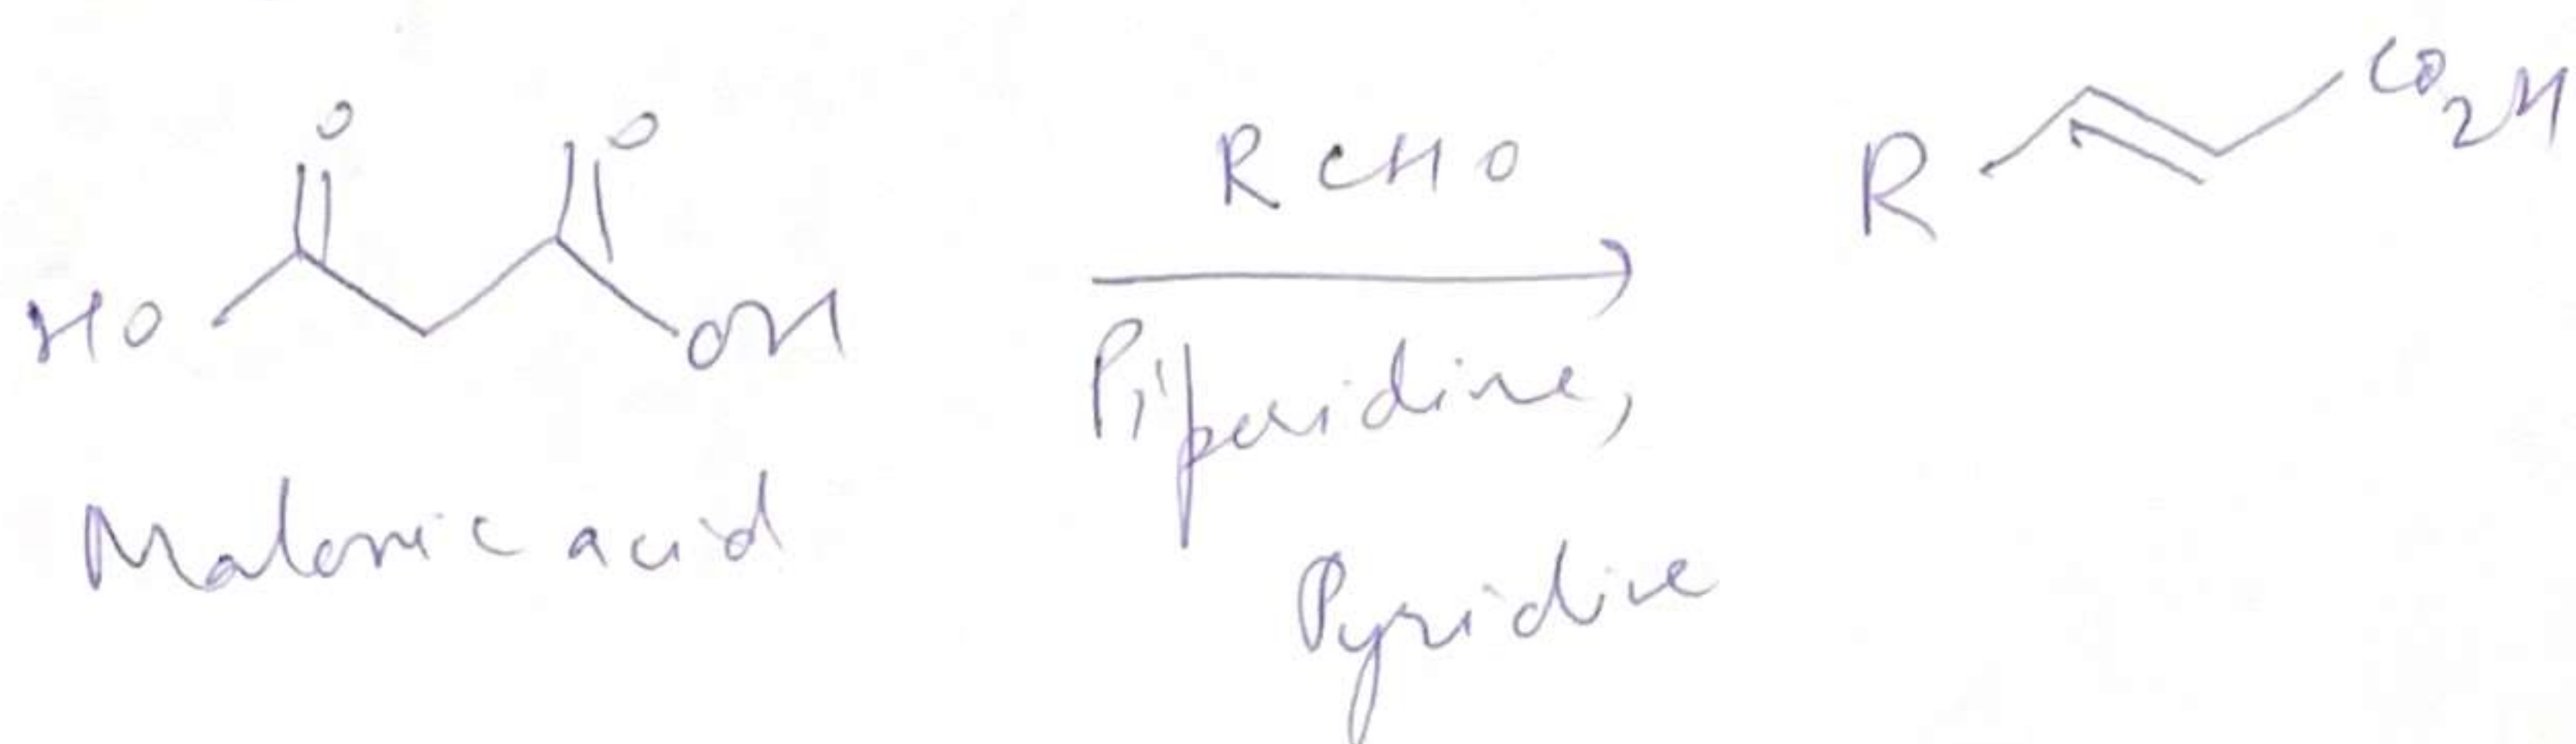

Knoevenagel Condensation

catalyst + weakly basic

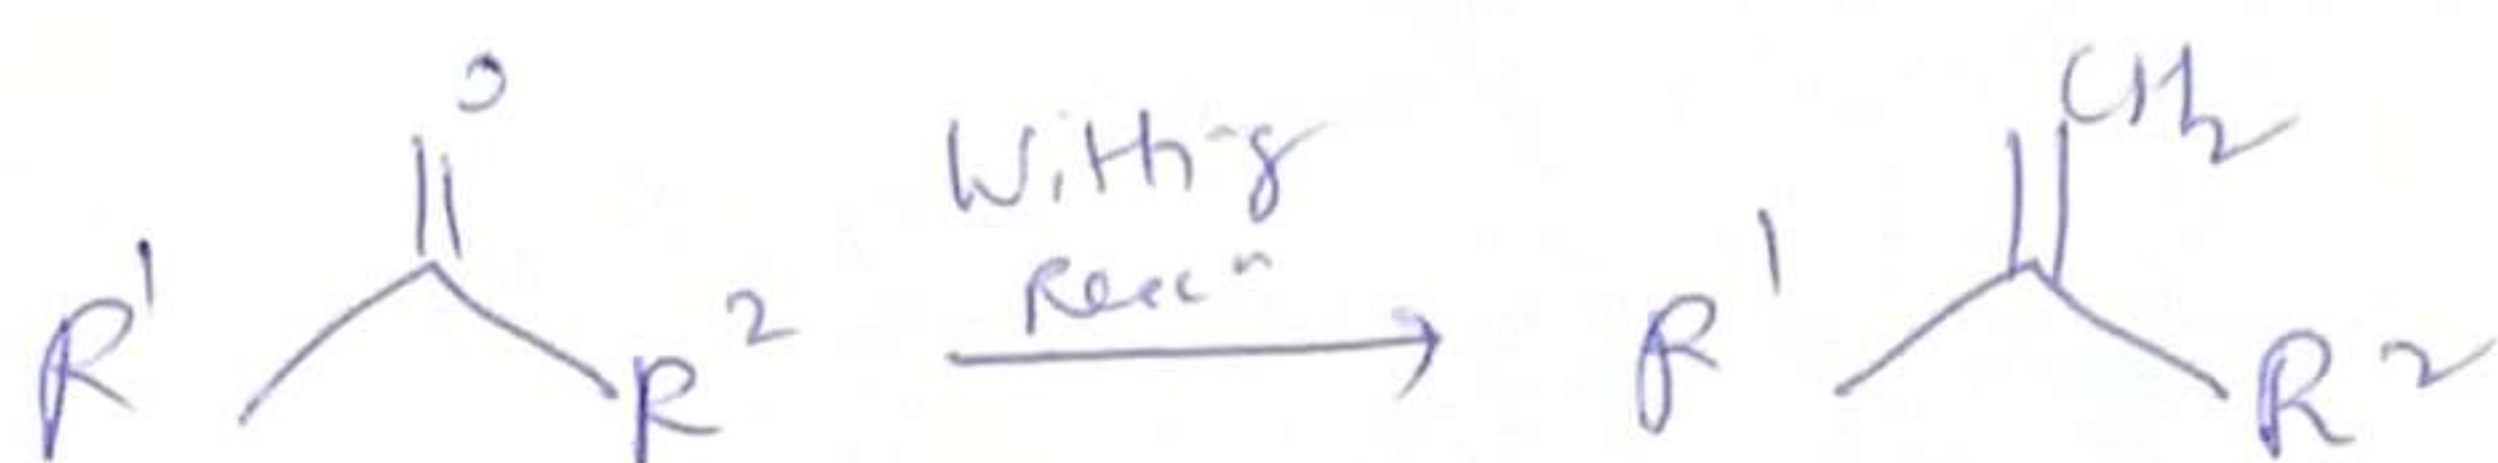

Active-H: Nitromethane, ethyl acetoacetate, diethyl malonate, cyanoacetylene

Nu⁺ addⁿ of an active hydrogen compound to a carbonyl group followed by dehydration reacⁿ.
Product is often α, β -unsaturated ketone.

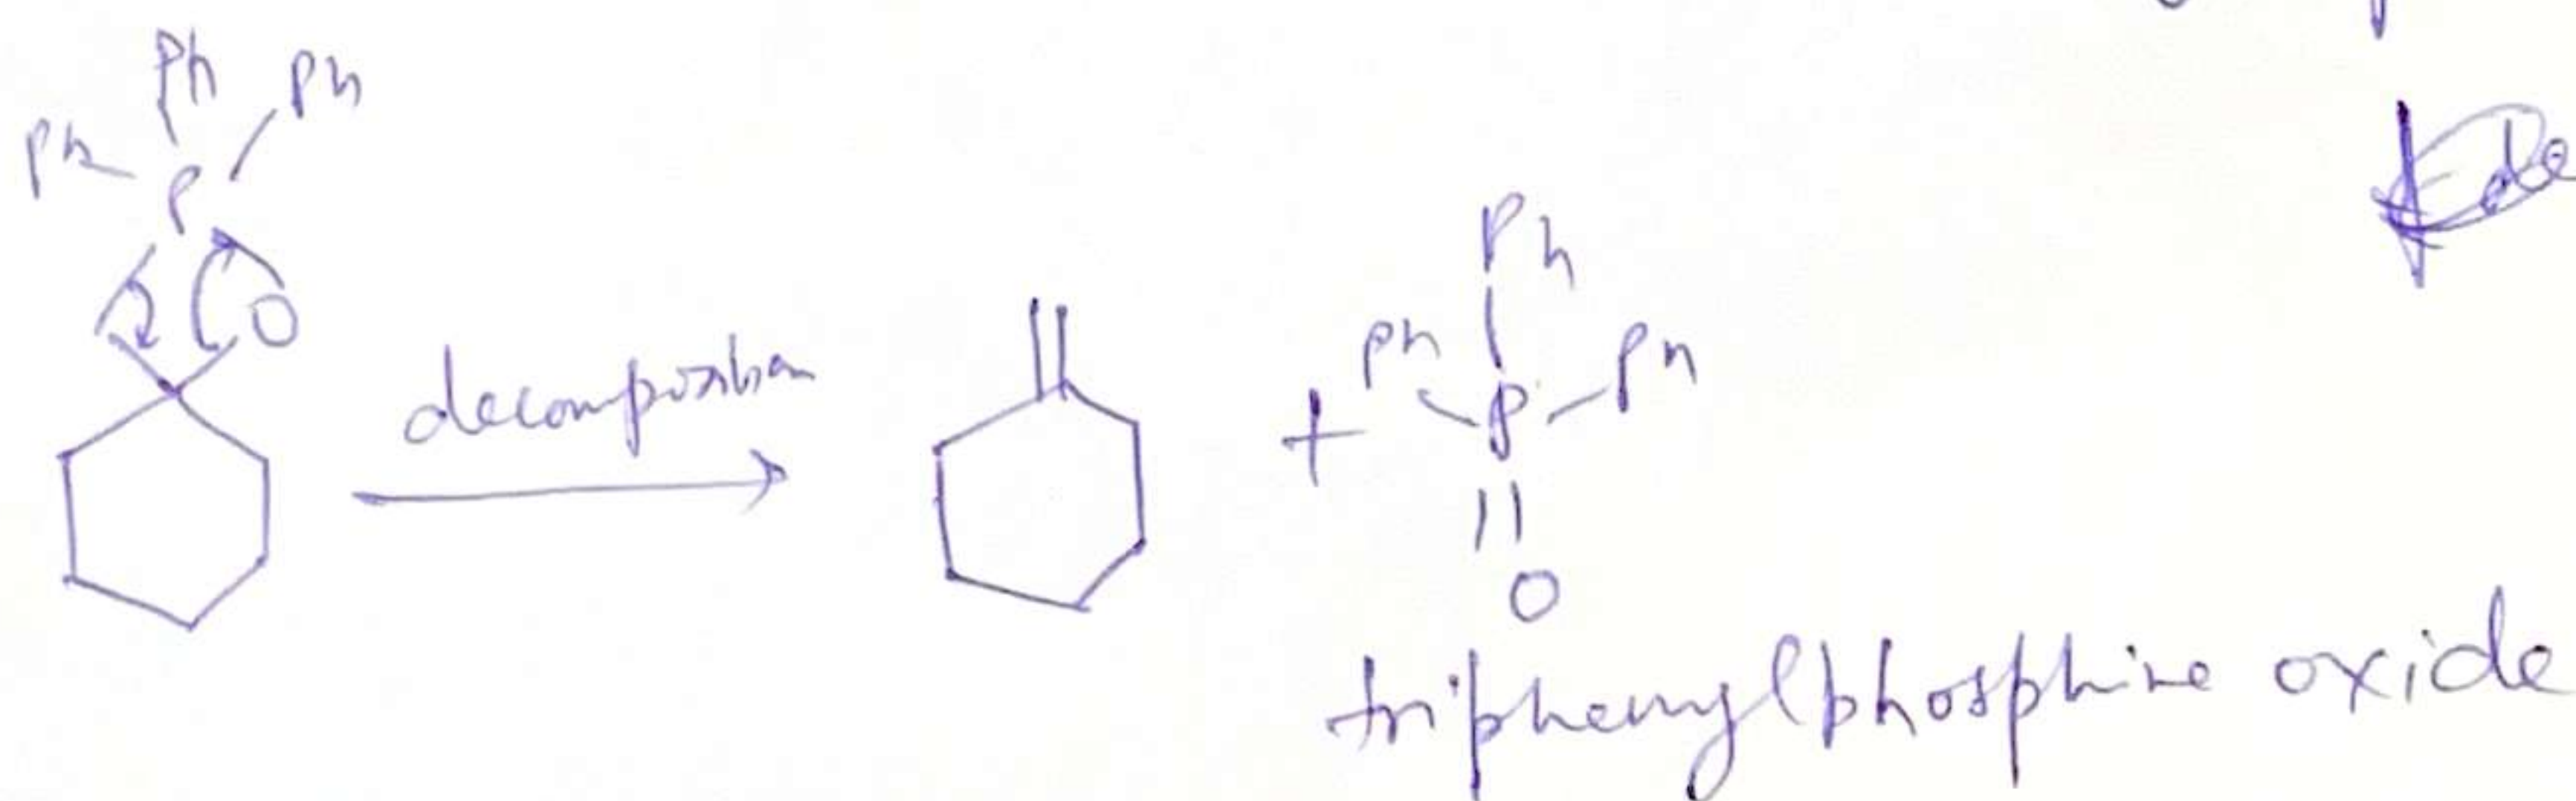

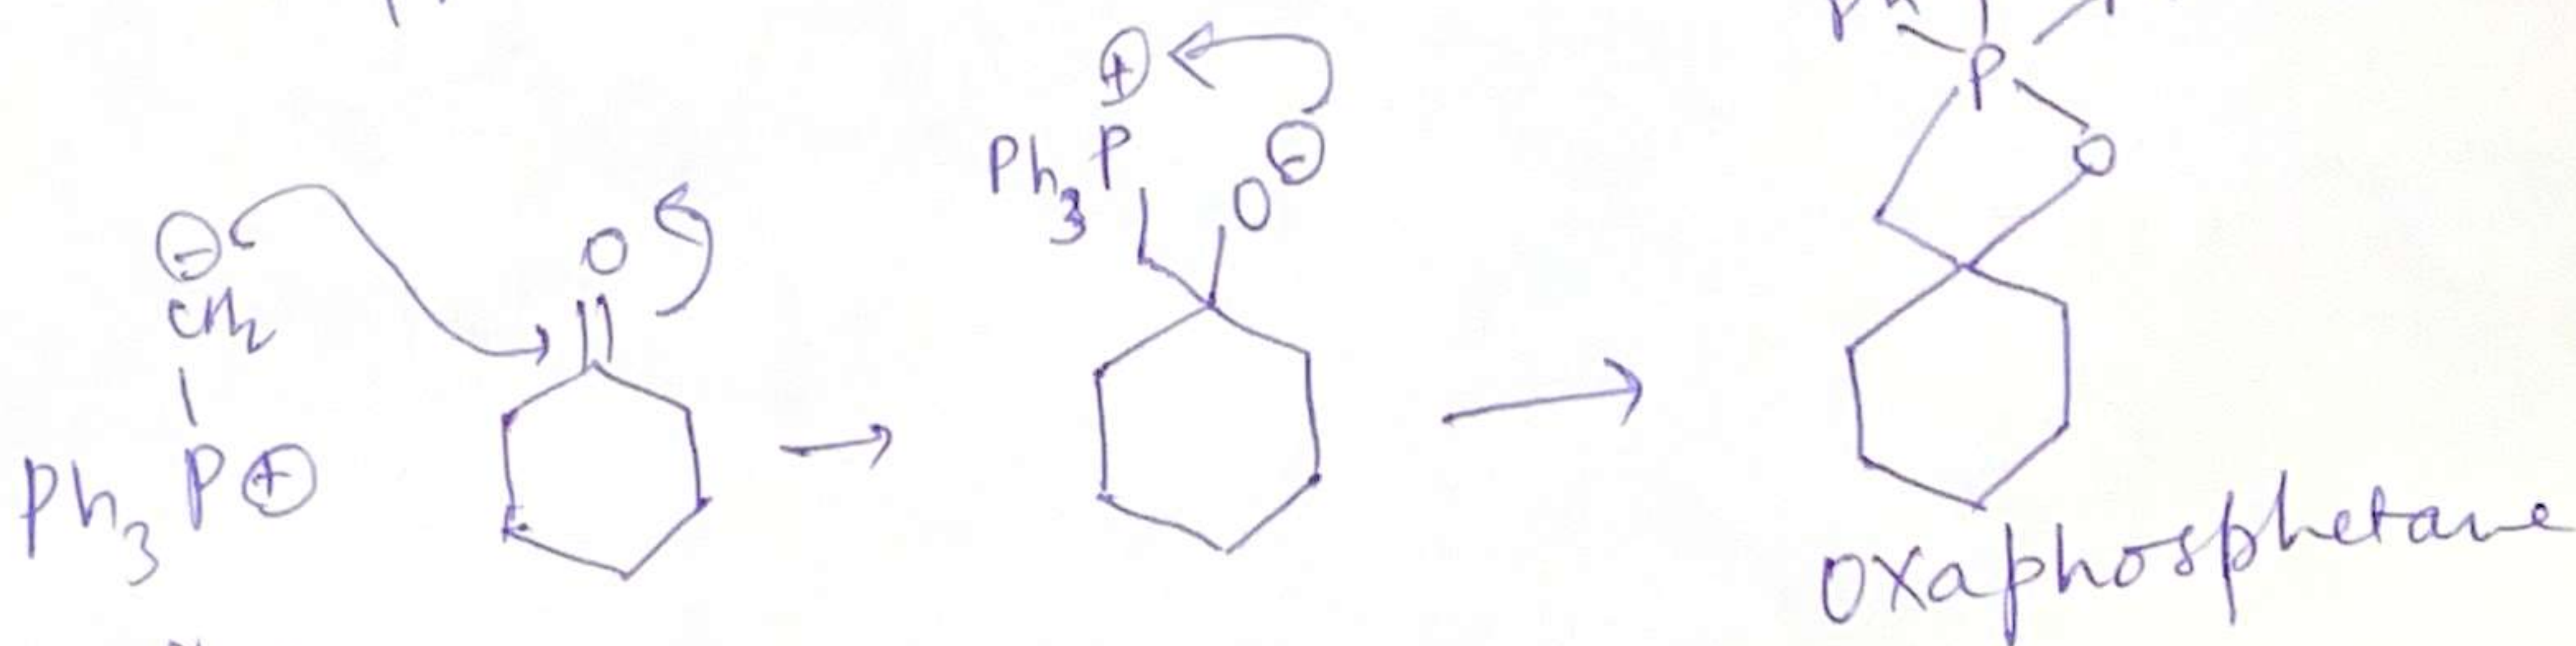

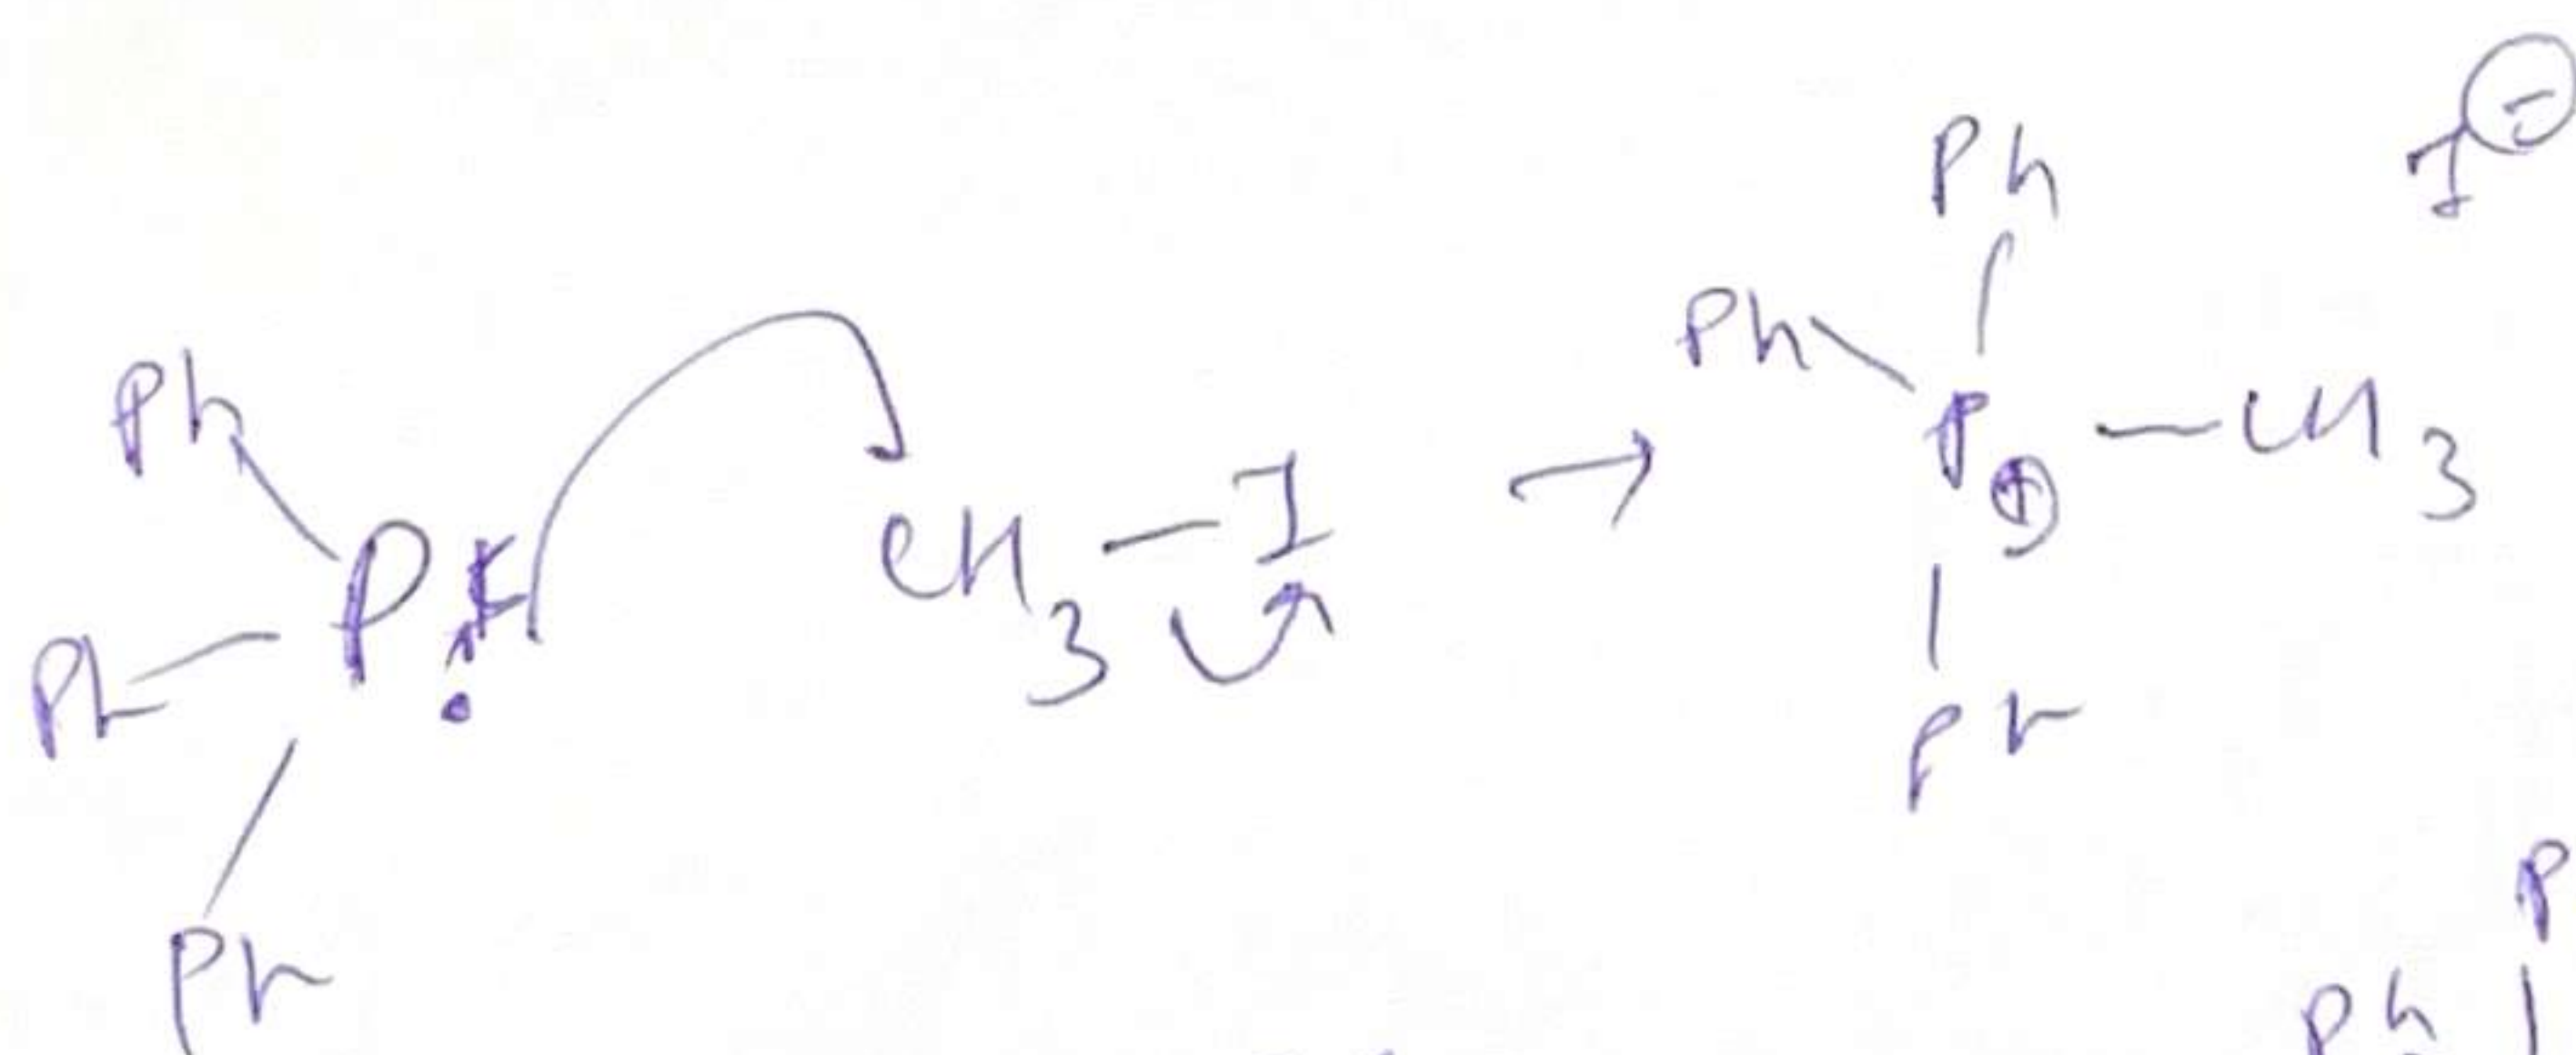

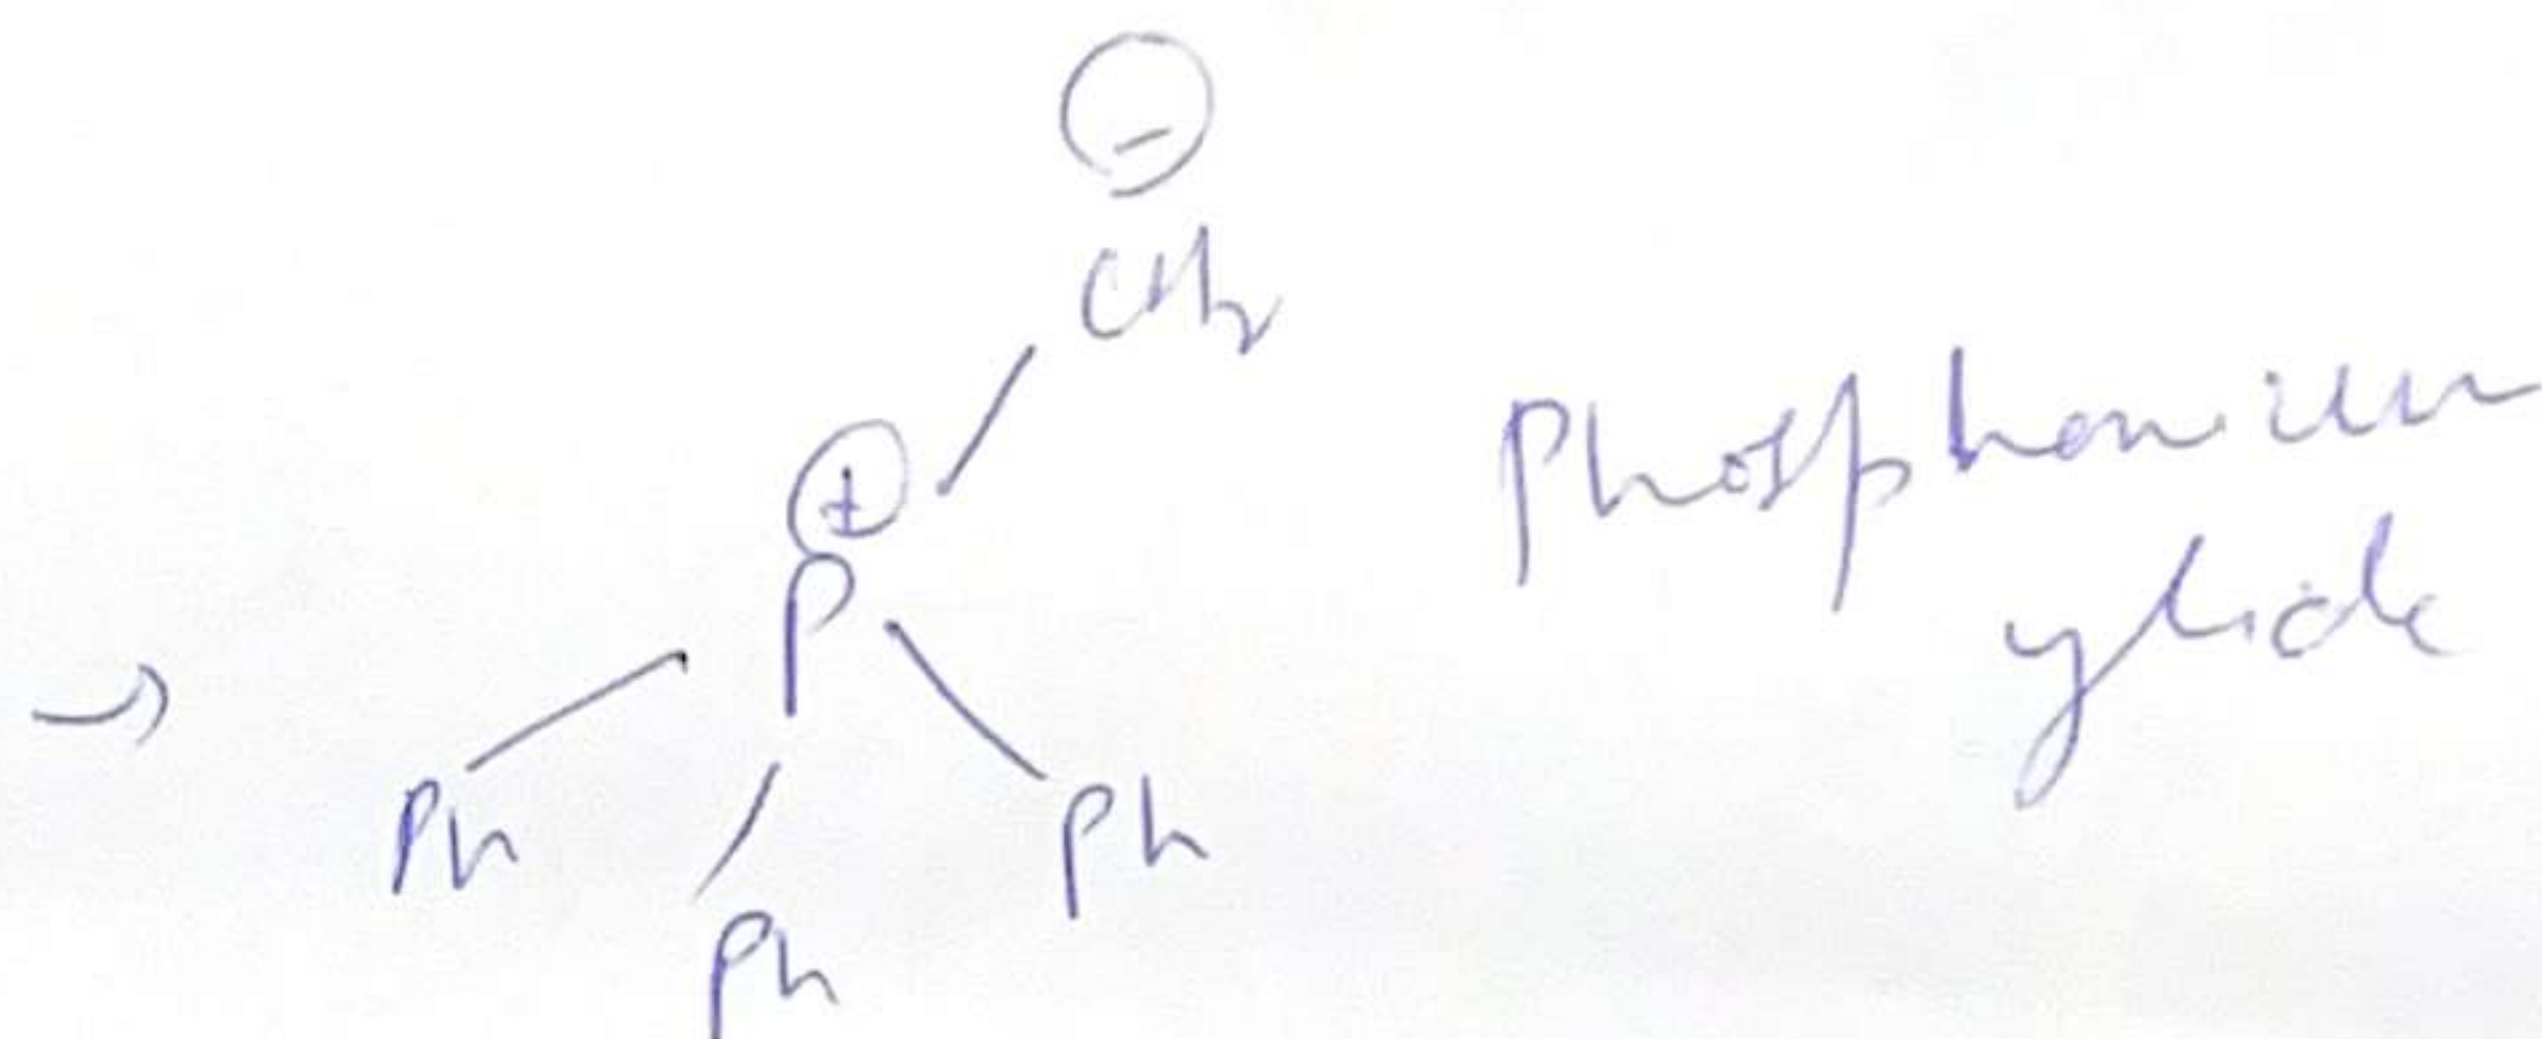

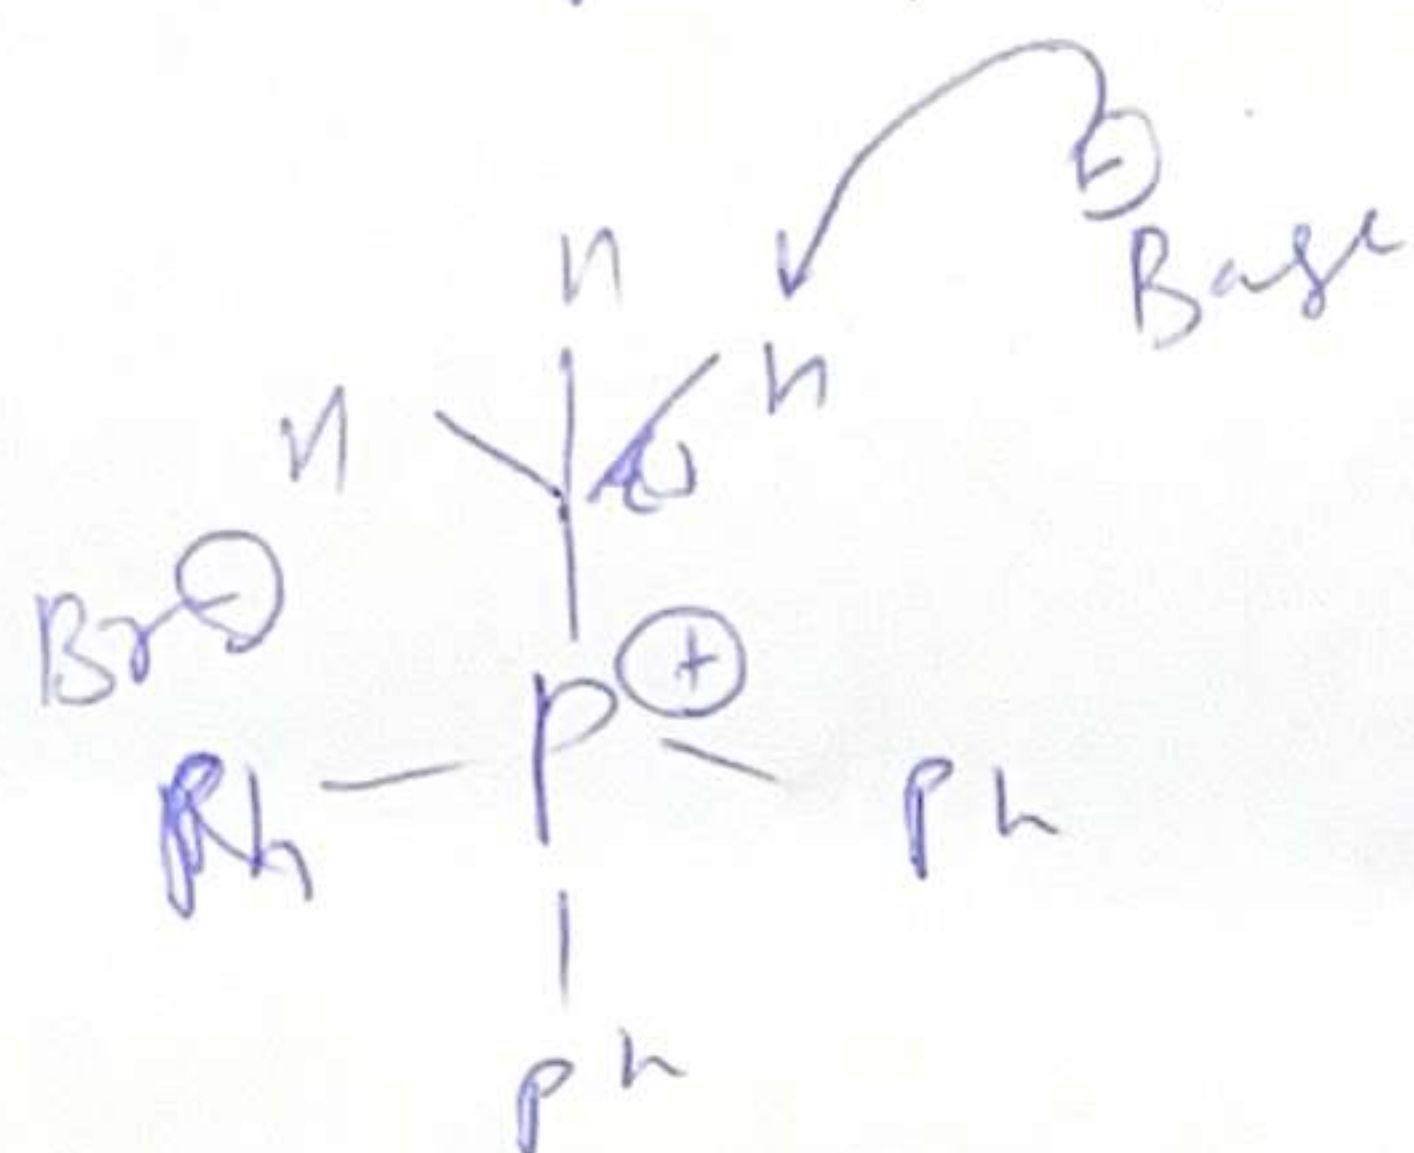

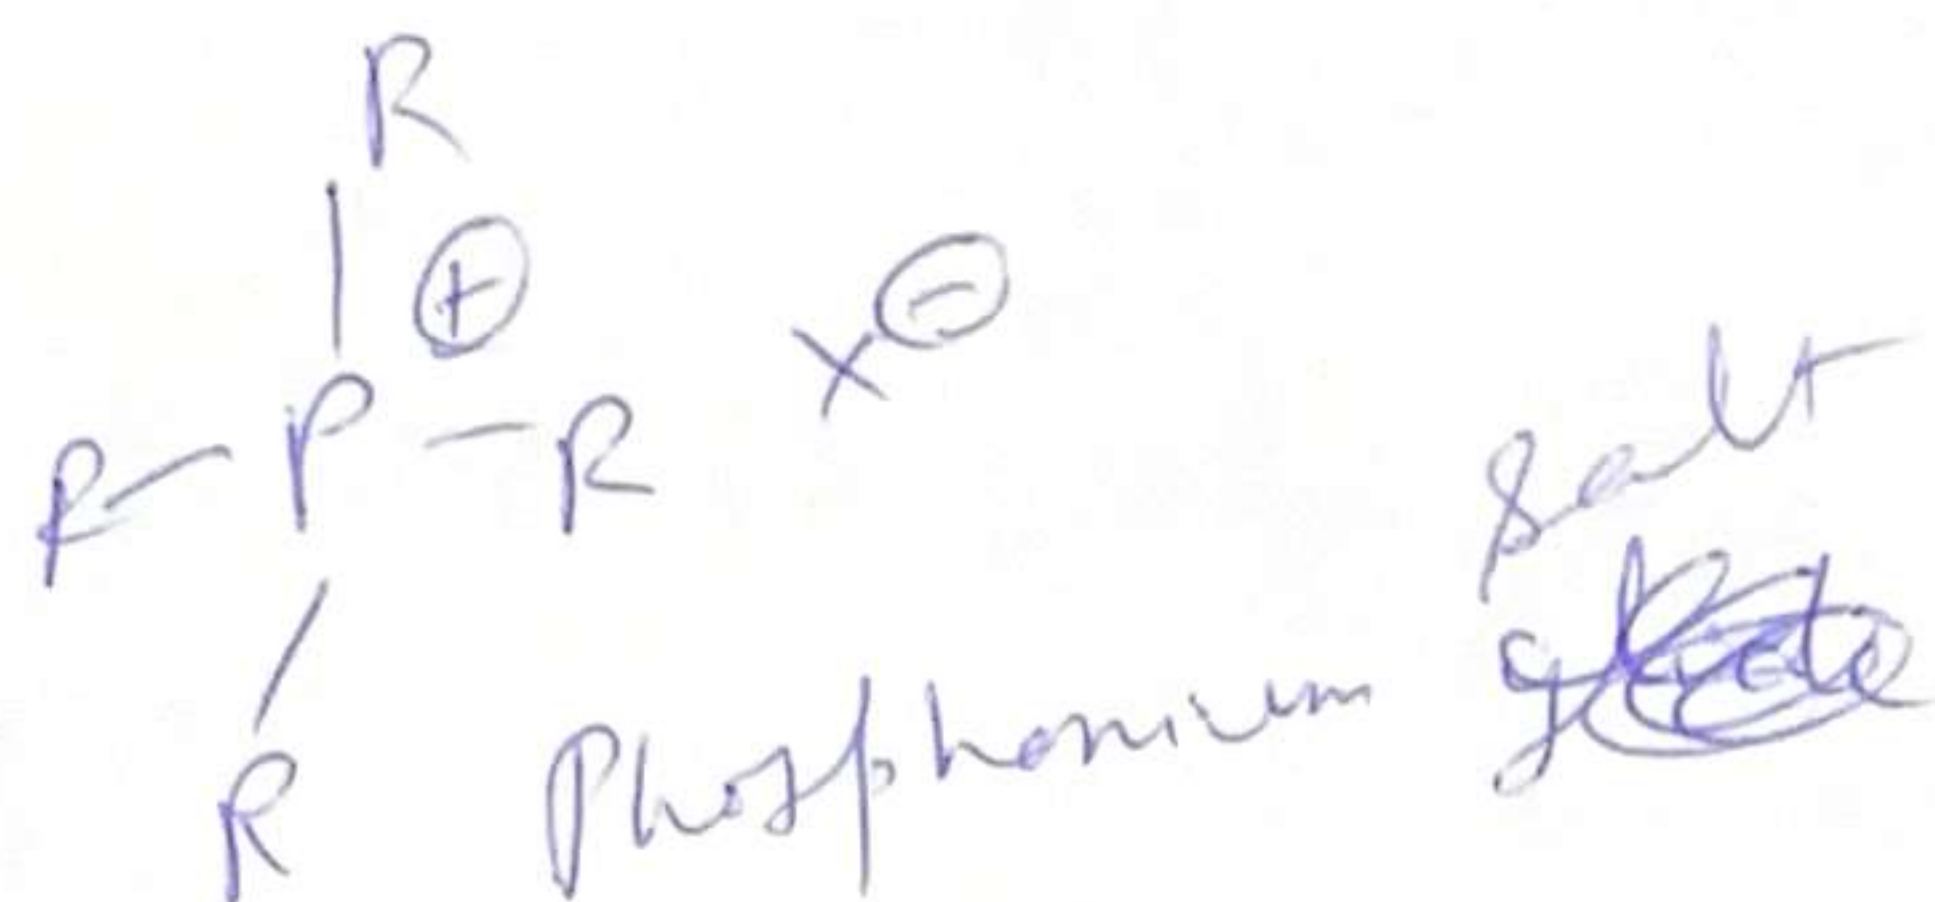

Wittig Reaction

10

Substitution of a $C=C$ bond for a $C=O$ bond
 Reaction betw. Carbonyl compd. (aldehyde/ketone only) & a phosphonium ylide.

P has strong affinity for O - ym

Gingnard Reacⁿ

Gingnard Reagent

organomagnesium halide

Aldehydes / ketones

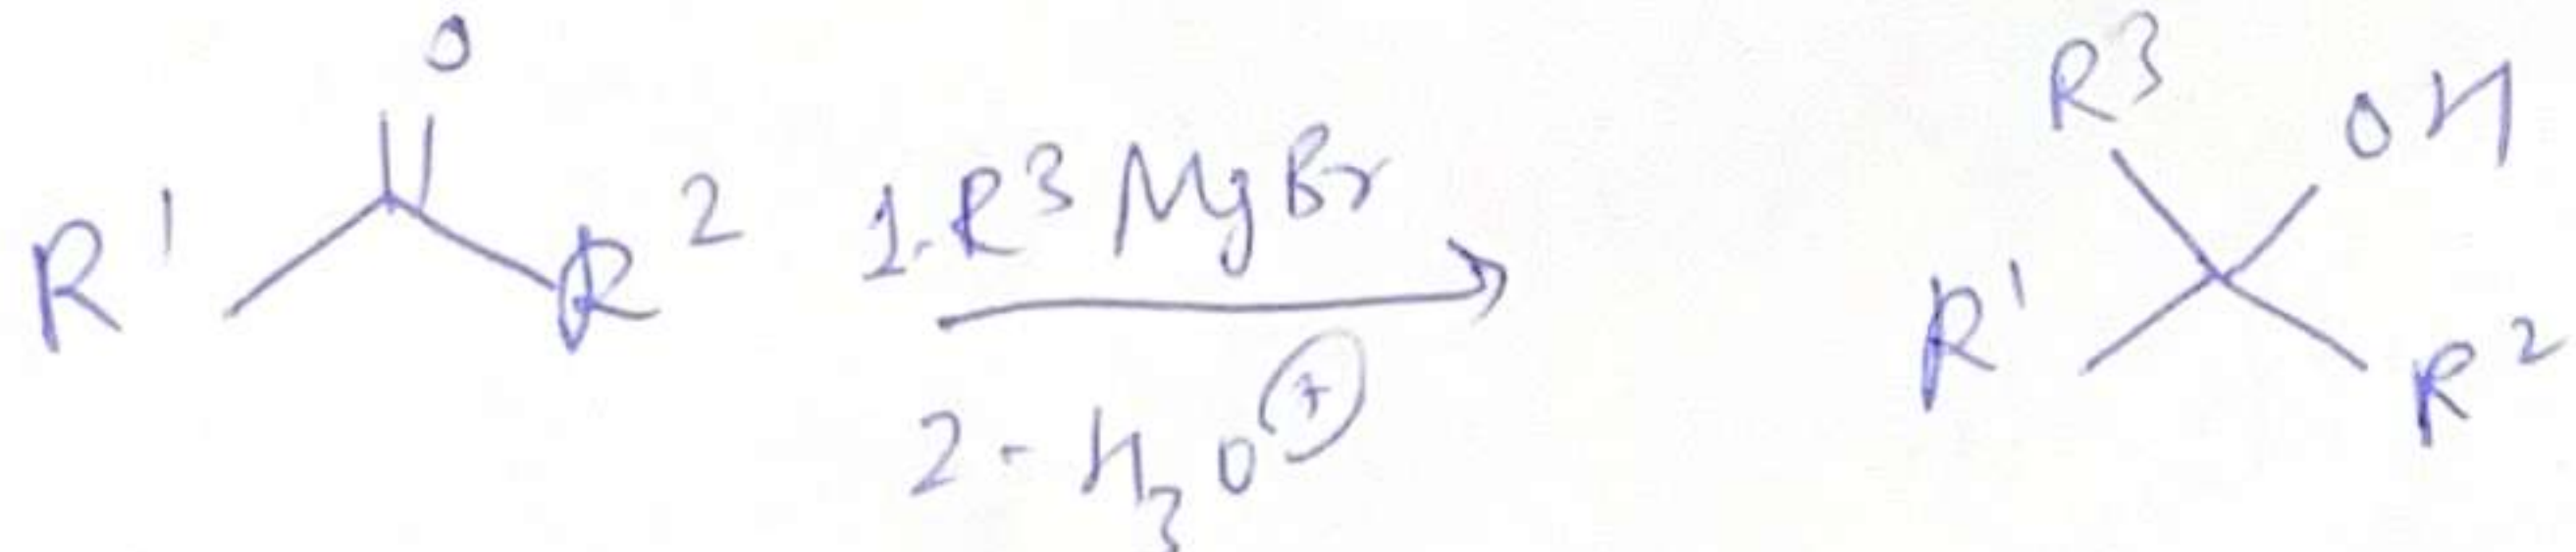

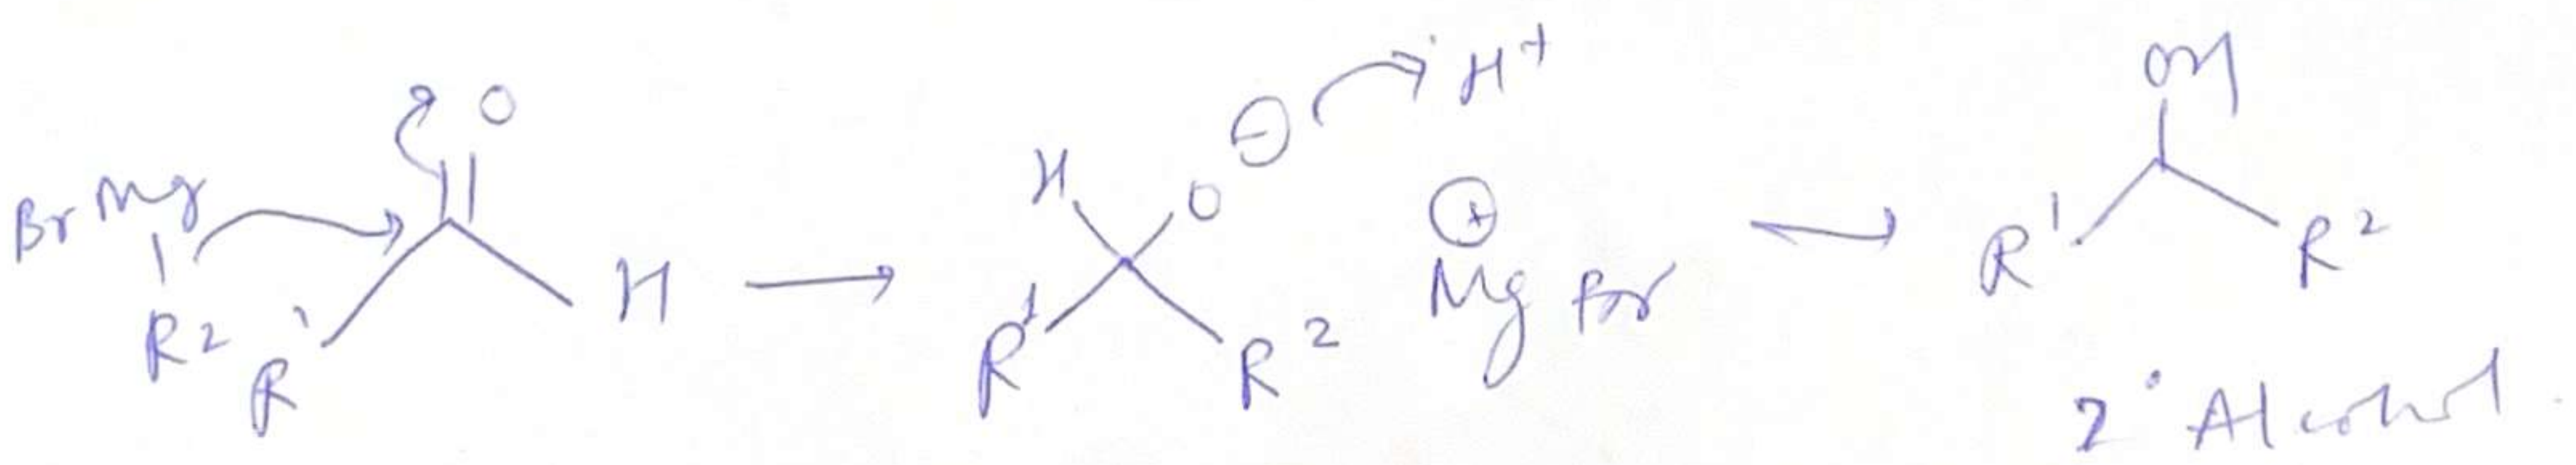

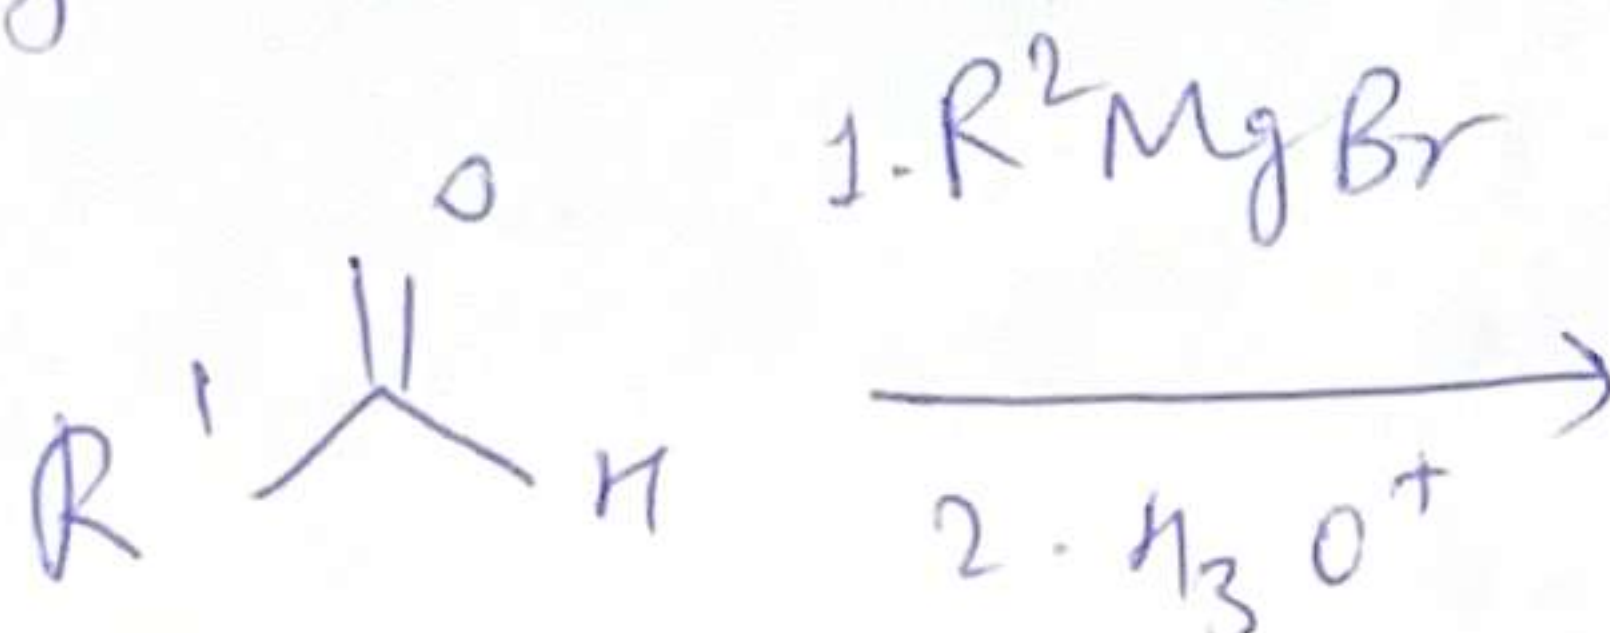

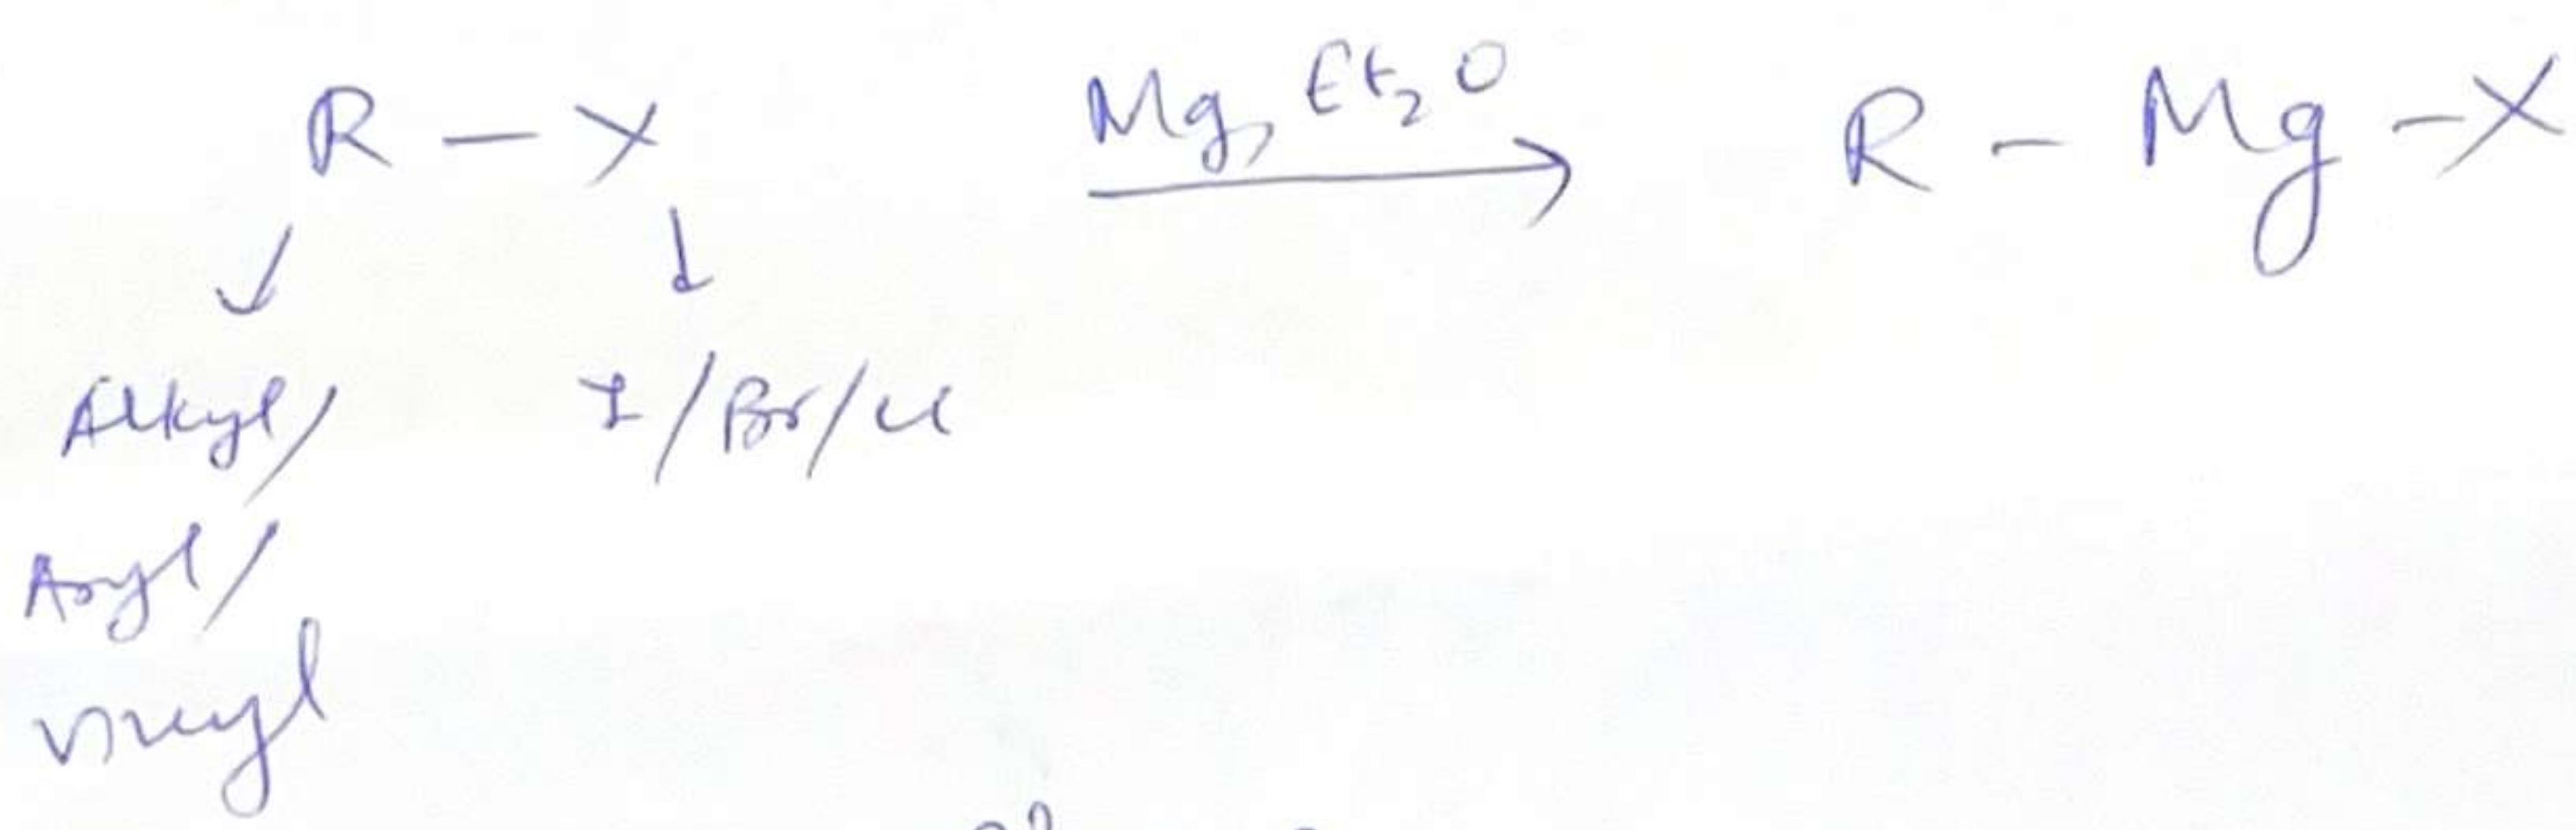

2° Alcohol

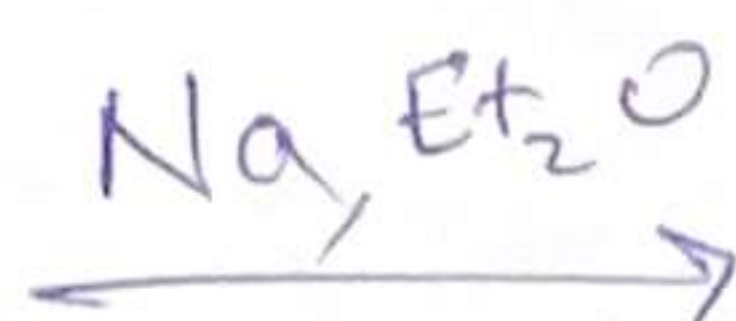

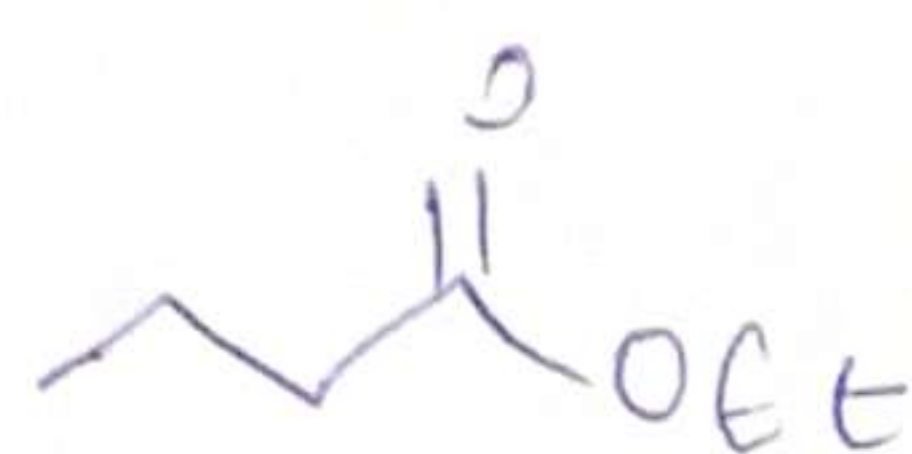

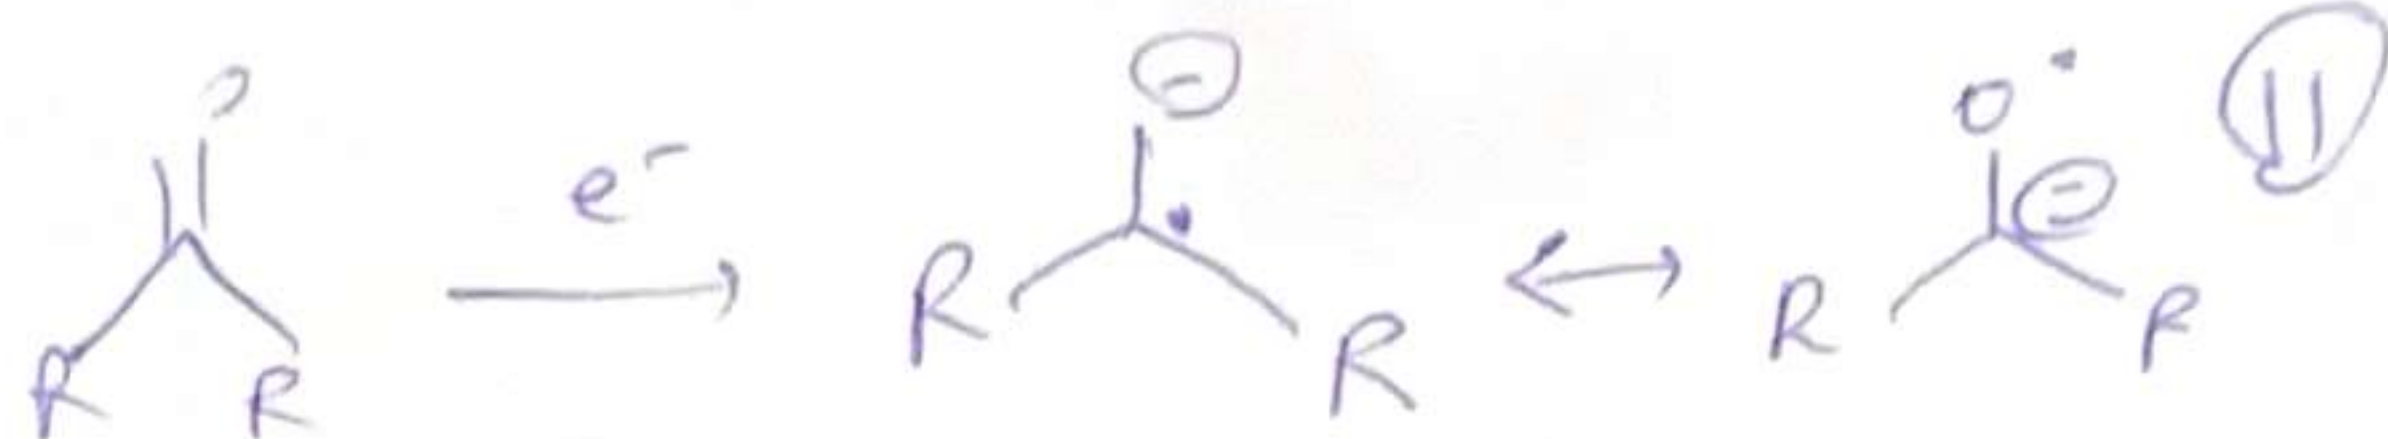

3° Alcohol

Can also work with esters, nitriles, epoxides leading to different products.

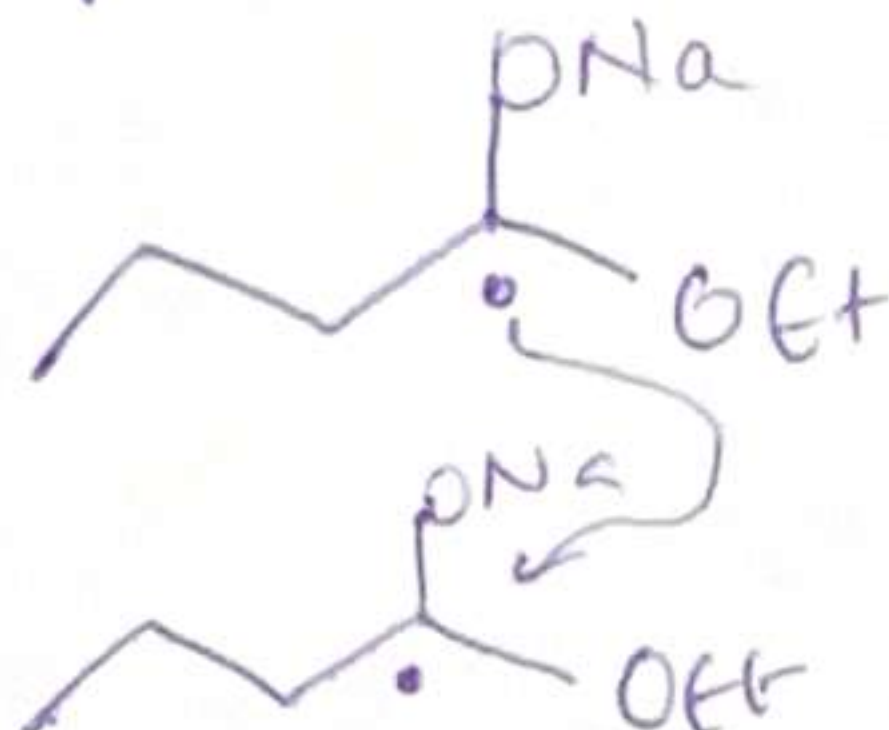

Acyloin Condensation

→ α -hydroxy ketone

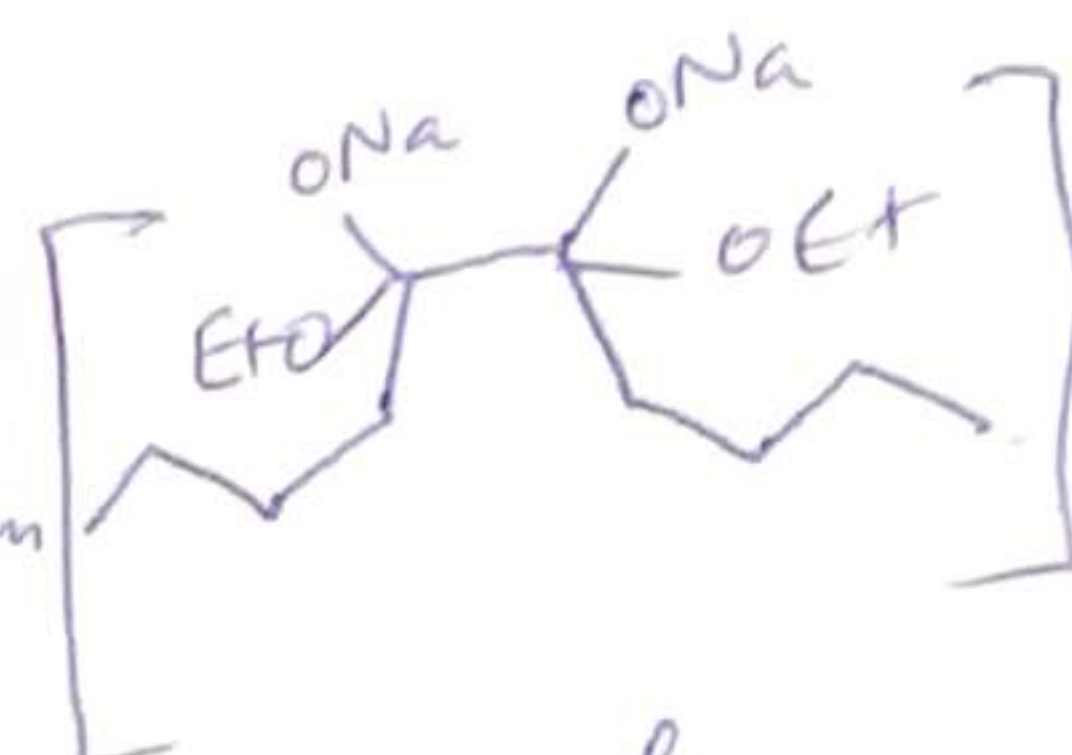

hexyl radical anion

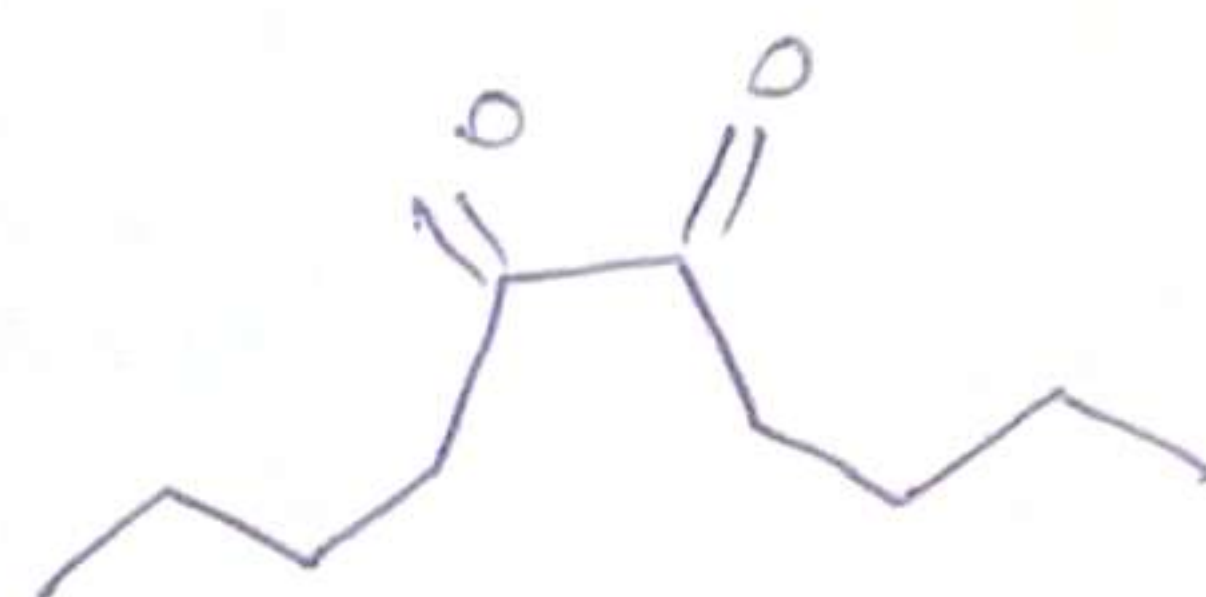

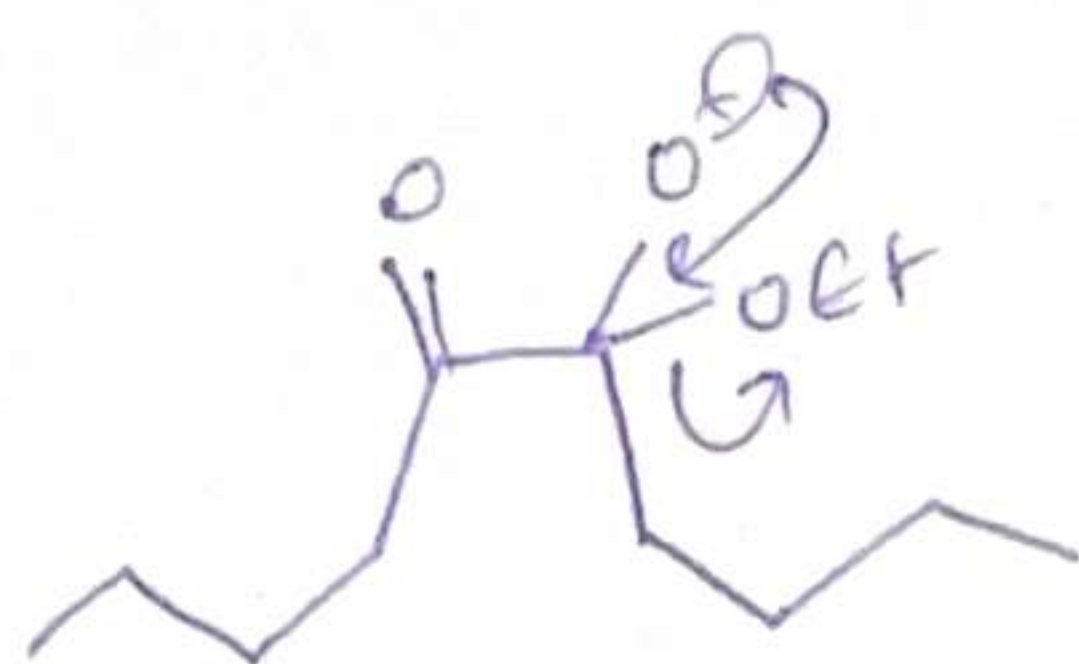

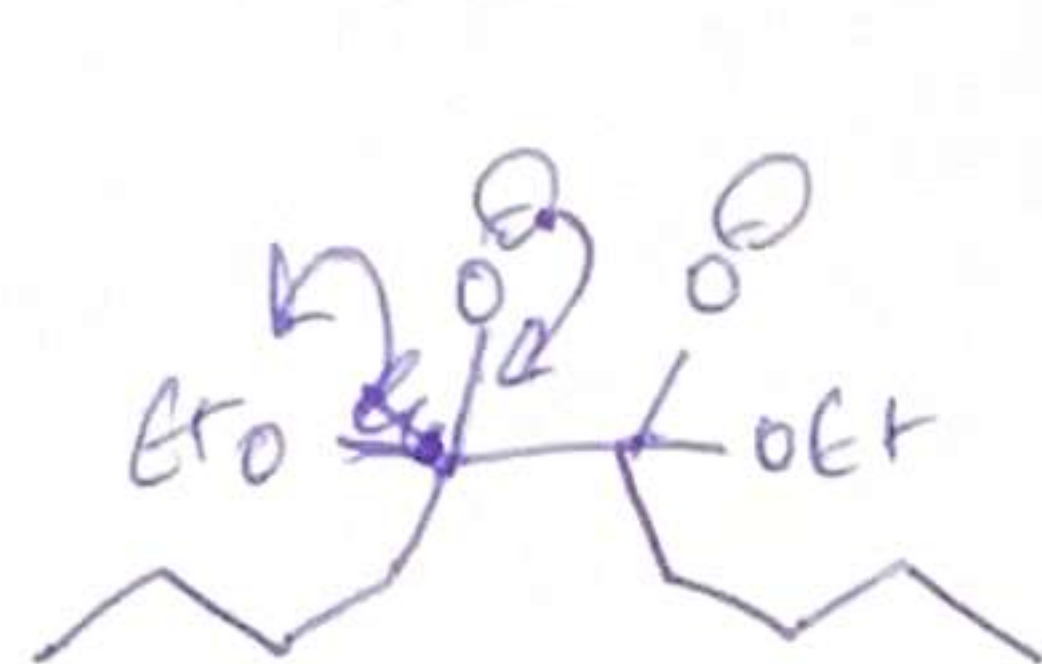

Radical

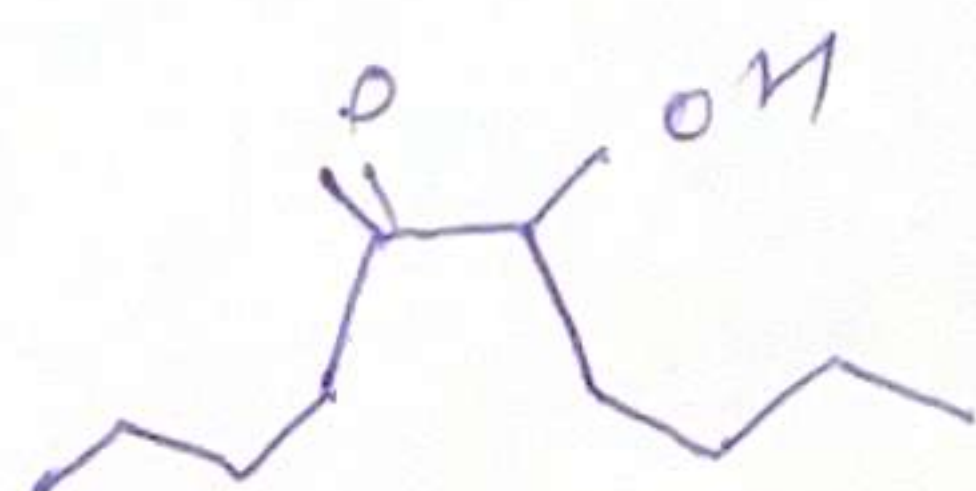

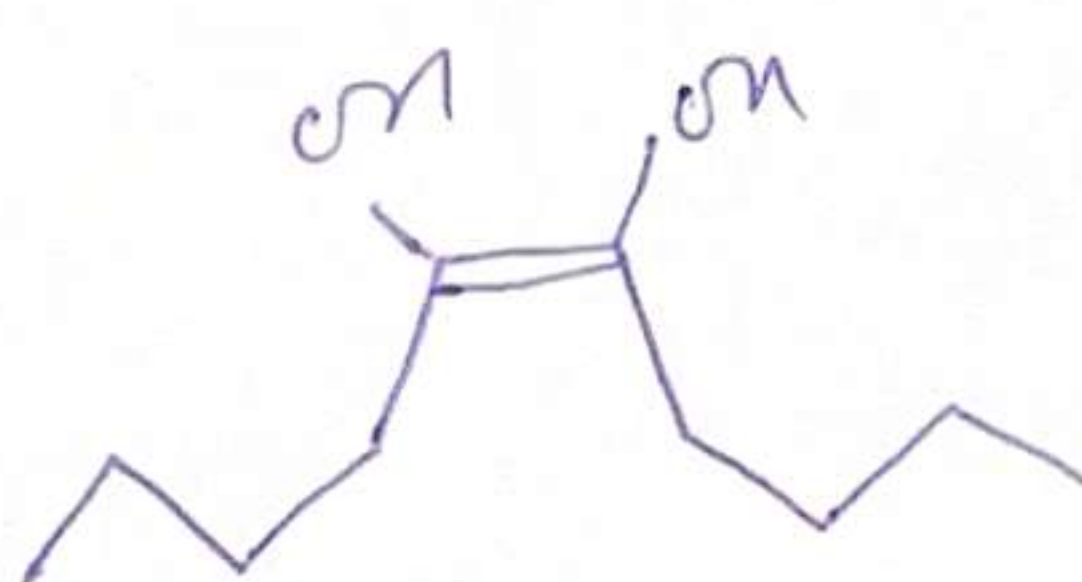

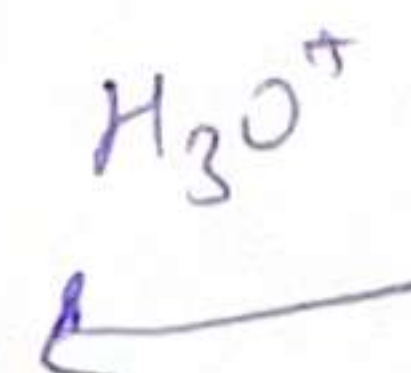

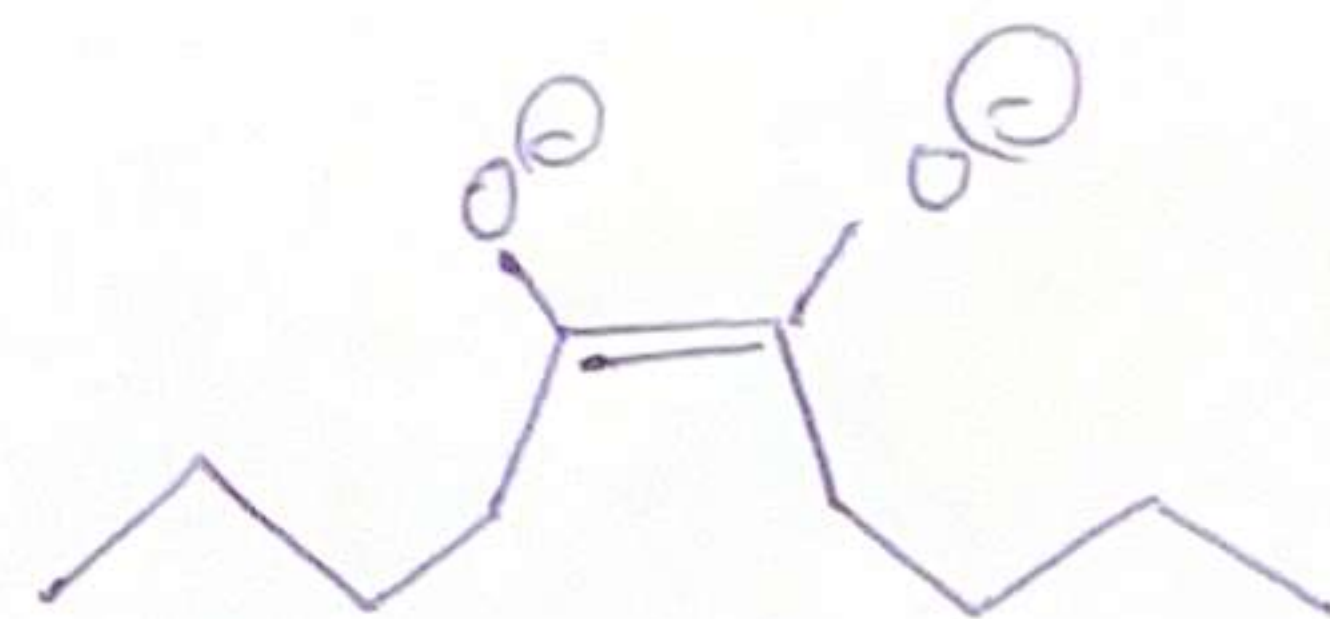

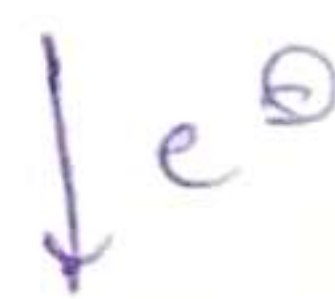

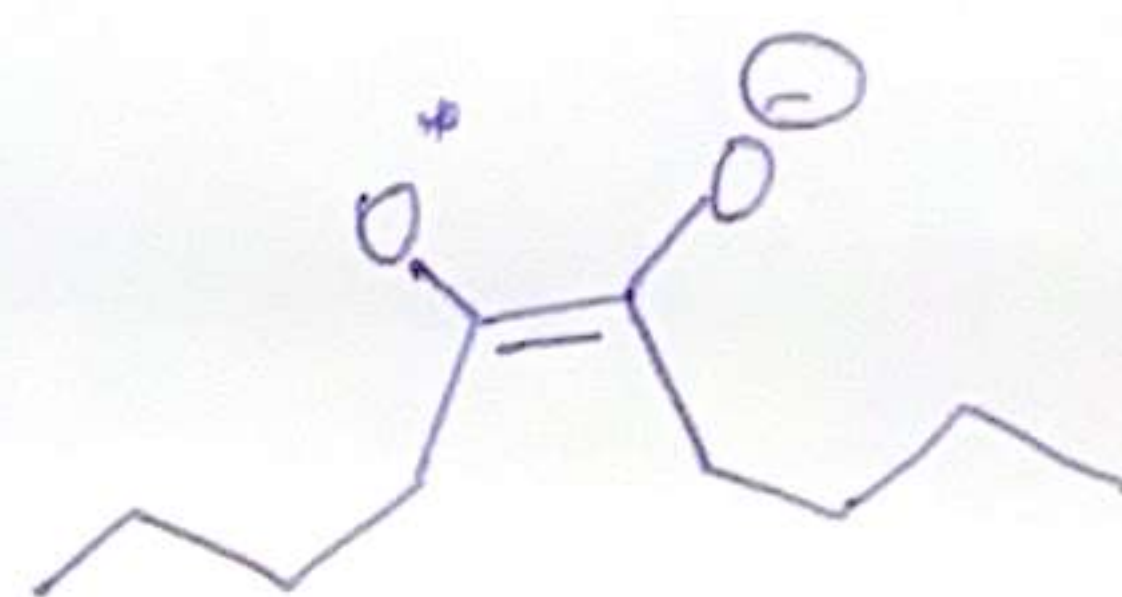

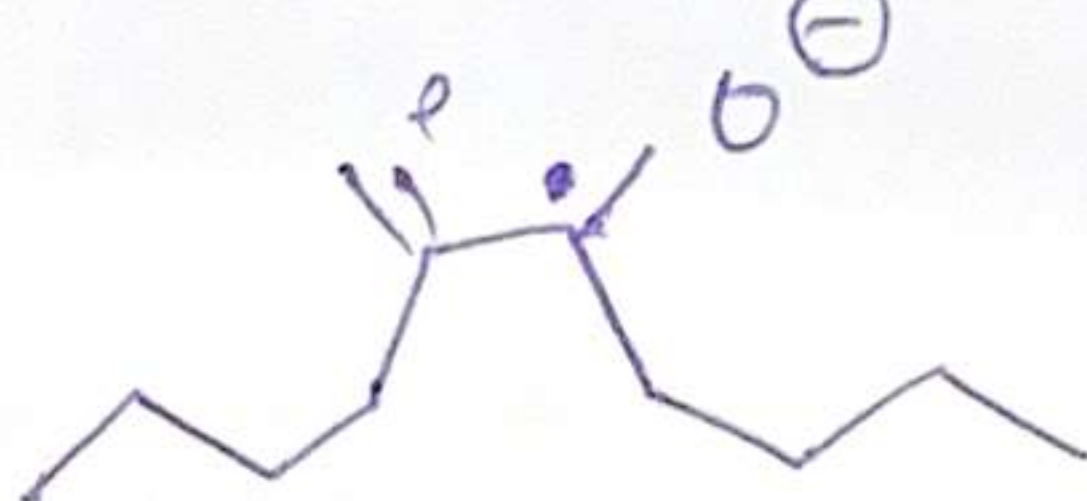

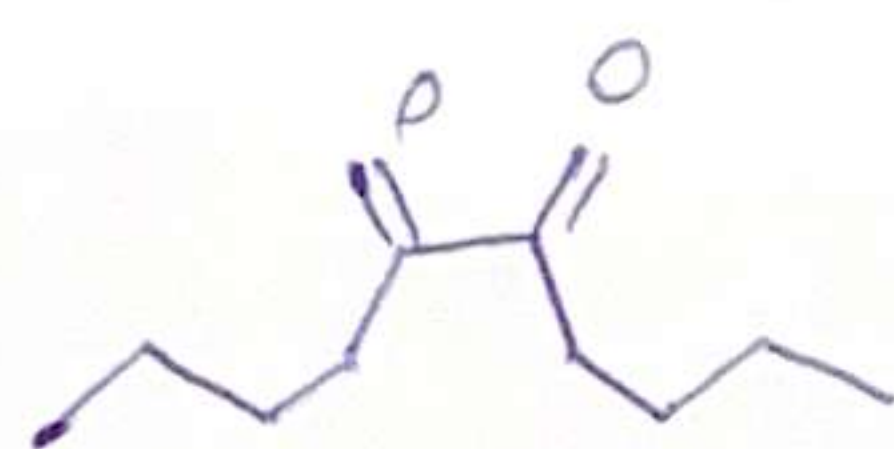

dimerization

Unstable initial Product

1,2-diketone

Acyloin
 α -hydroxy ketone
