Book by T. W. Graham Solomons

Transition Metal Chemistry [5 Lectures]: Colors in Complexes, Organometallics and Catalysis, Bioinorganic Chemistry

Organic Chemistry [8 Lectures]: Name Reactions, Stereochemistry and their Applications, Acid-Base Chemistry, Use of Buffers, Organic Chemistry examples such as polymers and biopolymers, drugs and photoactive molecules in everyday life and advanced technologies

Fischer Projection

1. The carbon chain is drawn along the vertical line of the Fischer projection, usually with the most highly oxidized end carbon atom at the top.

Vertical lines: bonds going into the page.

Horizontal lines: bonds coming out of the page

180° rotation (not 90° or 270°):

–COOH and –CH₃ go into plane of paper in both projections;
–H and –OH come out of plane of paper in both projections.

Same as

(R)-Lactic acid

90° rotation

Same as

(S)-Lactic acid

Hold steady

Same as

Chiral compounds with no stereogenic centres

steric hindrance

nonsuperimposable enantiomers

Resolution

Separation of Enantiomers

1. Resolution *via* Diastereomer Formation:

- Diastereomers, because they have different melting points, different boiling points, and different solubilities, can be separated by conventional methods.

2. Resolution *via* Molecular Complexes, Metal Complexes, and Inclusion Compounds.

3. Chromatographic Resolution

4. Kinetic Resolution

Resolution

A separation of two enantiomers is called a **resolution**. Resolutions can be carried out only if we make use of a component that is already enantiomerically pure.

diastereoisomer A

m.p. 103–104 °C

$[\alpha]_D -57.7$

KOH, EtOH, H₂O

m.p. 152–153 °C
 $[\alpha]_D -7.3$

20% NaOH, boil 40 h

(*R*)-enantiomer

diastereoisomer B

m.p. 72.5–73.5 °C

$[\alpha]_D -29.2$

KOH, EtOH, H₂O

m.p. 152.5–154 °C
 $[\alpha]_D +8.0$

20% NaOH, boil 40 h

(*S*)-enantiomer

two enantiomers resolved

Resolutions using diastereoisomeric salts

(S)-naproxen

ibuprofen

2-arylpropionic acids

resolution of naproxen via an amine salt

(±)-naproxen

N-propylglucosamine

mixed to give

soluble salt

crystalline salt

filtered off and
basified with NaOH

sodium salt of (S)-naproxen

reusable

N-propylglucosamine

Resolution by Column Chromatography

Chromatography on a chiral stationary phase is especially important when the compounds being resolved have no functional groups suitable for making the derivatives (usually esters or salts) needed for the more classical resolutions.

1. racemic mixture loaded on to column

R S

column →

2. compound forced through column using an eluent

3. S enantiomer has a greater affinity for the chiral stationary phase, so it travels more slowly

4. R enantiomer reaches the bottom of the column first

5. the enantiomers are resolved

Enantioselective Synthesis

- 1) In an enantioselective reaction, one enantiomer is produced predominantly over its mirror image.
- 2) In an enantioselective reaction, a chiral reagent, catalyst, or solvent must assert an influence on the course of the reaction.

For example, in nature, where most reactions are enantioselective, the chiral influences come from protein molecules called enzymes. Enzymes possess an *active site* where only one enantiomer of a chiral reactant fits it properly and is able to undergo reaction.

Racemic Synthesis

For a sugar drawn in the Fischer projection with the most oxidized carbon at the top:

- If the OH on the bottom chiral center points to the **right**, the sugar is **D**
- If the OH on the bottom chiral center points to the **left**, the sugar is **L**

The D- L- system can also be applied to other chiral molecules, e.g. amino acids:
